

# TMC2242A/TMC2242B

## Digital Half-Band Interpolating/Decimating Filter

12-bit In/16-bit Out, 60 MHz

### Features

- TMC2242A and TMC2242B are pin-compatible with TMC2242
- User selectable interpolate gain, -6 dB or 0 dB (2242B)
- 30, 40 and 60 MHz speed grades
- User selectable 2:1 decimation, 1:2 interpolation, and equal-rate filter modes
- Passband ripple <  $\pm 0.01$  dB
- Stopband rejection 59.4 dB from 0.28 to  $0.50 \times f_s$
- Cascading two TMC2242A or TMC2242B meets CCIR 601 low-pass filter requirement
- Dedicated 12-bit 2's complement input data port and 16-bit output data port with user-selectable rounding from 9 to 16 bits
- Two's complement or offset binary output format
- Built-in limiter prevents overflow

- Single +5 Volt power supply operation
- Small 44-Lead PLCC and 44-Lead MQFP

### Applications

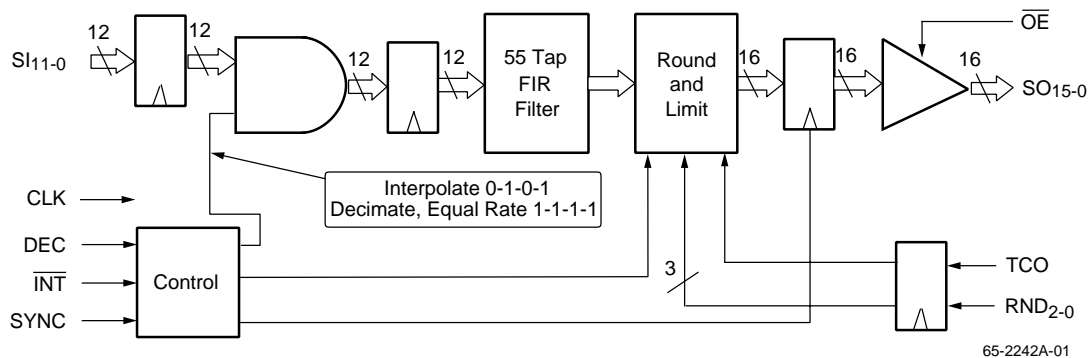

- Low-cost video filtering
- Chrominance bandwidth limiter
- Simple, inexpensive video D/A post-filters
- Reduced cost and complexity for A/D anti-aliasing filters
- High-performance digital low-pass filters
- Digital waveform reconstruction post-filtering
- Telecommunications
- Direct digital synthesis
- Radar

### Description

The TMC2242A and TMC2242B are fixed-coefficient linear-phase half-band (low-pass) digital filters. They can be used to halve or double the sampling rate of a digital signal. When used as a decimating post-filter with a double-speed oversampling A/D converter, they greatly reduce the cost and complexity of anti-aliasing filters required ahead of the A/D converter. When used as an interpolating pre-filter with a double-speed oversampling D/A converter, the TMC2242A and TMC2242B significantly reduce the design complexity and production cost of reconstruction filters used on D/A outputs.

The TMC2242A and TMC2242B user selects the mode of operation (decimate, interpolate, or equal-rate) and rounding. The TMC2242A and TMC2242B accept 12-bit 2's complement data at up to 60 MHz and output saturated (overflow-protected) 2's complement or offset binary data rounded to from 9 to 16 bits. Within the speed grade I/O limit, the output sample rate may be 1/2, 1, or 2 times the input sample rate.

### Block Diagram

## Description (continued)

The filter response is flat to within  $\pm 0.01$  dB from  $0.00$  to  $0.22 \times f_s$ , with stopband attenuation greater than 59.4 dB from  $0.28 \times f_s$  to the Nyquist frequency. The response is 6 dB down at  $0.25 \times f_s$ . Symmetric-coefficient filters such as the TMC2242A and TMC2242B have linear phase response. Full compliance with the CCIR-601 standard of 12 dB attenuation at  $0.25 \times f_s$  is achieved by cascading two parts.

The TMC2242A and TMC2242B are fabricated on an advanced submicron CMOS process. They are available in a 44-lead J-lead PLCC package. Performance is guaranteed from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ .

## Functional Description

The TMC2242A and TMC2242B implement a fixed-coefficient linear-phase Finite Impulse Response (FIR) filter of 55 effective taps, with special rate-matching input and output structures to facilitate 2:1 decimation and 1:2 interpolation. The faster of either the input or output registers will operate at the guaranteed maximum clock rate (speed grade). The total internal pipeline latency from the input of an impulse to the corresponding output peak (digital group delay) is 34 cycles; the 55-value output response begins after 7 clock cycles and ends after 61 cycles.

To perform interpolation, the chip slows the effective input register clock rate to half the output rate. It internally inserts zeroes between the incoming data samples to "pad" the input data rate to match the output rate.

To perform decimation, the chip sets the output register clock rate to half of the input rate. One output is then obtained for every two inputs.

For interpolation, the user should bring SYNC HIGH for at least one clock cycle, returning it LOW with the first desired input data value. When interpolating, the chip will then continue to accept a new data input on each alternate rising edge of the clock. When decimating, the chip will present one output value for every two clock cycles. The user may leave SYNC LOW or toggle it once per rising clock edge, with equivalent performance.

The output data format is two's complement if TCO is HIGH, inverted offset binary if LOW. The user can tailor the output data word width to his/her system requirements using the Rounding control. As shown in Table 4, the output is half-LSB rounded to the resolution selected by the value of RND2-0. The asynchronous three-state output enable control simplifies connection to a data bus with other drivers.

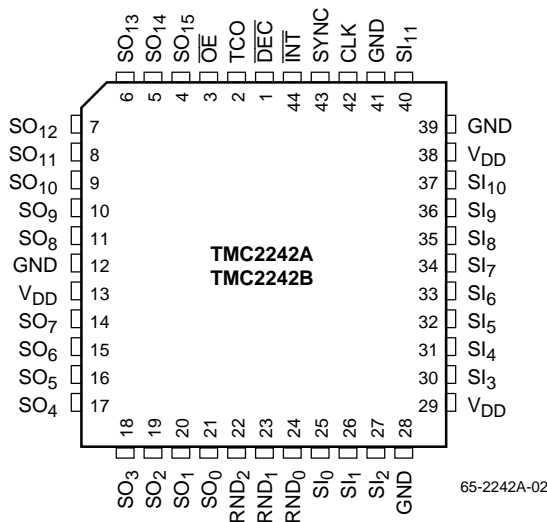

**Table 1. Operating Modes**

DEC	INT	TMC2242A	TMC2242B
0	0	Equal Rate	Interpolate (0 dB)
0	1	Decimate	Decimate
1	0	Interpolate (-6 dB)	Interpolate (-6 dB) <sup>1</sup>
1	1	Equal Rate	Equal Rate

**Note:**

1. With 15-bit overflow protection. All other modes on both parts limit to 16 bits.

## Pin Assignments

**44 Lead PLCC**

**44 Lead MQFP**

## Pin Descriptions

Pin Name	Pin Number		Pin Function Description
	PLCC	MQFP	
<b>Timing Controls</b>			
$\overline{\text{INT}}$	44	38	<b>Interpolate.</b> When $\overline{\text{INT}}$ is LOW and $\overline{\text{DEC}}$ is HIGH, the input data register runs at 1/2 the CLK rate and zeros are inserted in the data stream between valid input values, reducing gain by 6dB. The TMC2242A and TMC2242B interpolate and output results at the full CLK rate.
$\overline{\text{DEC}}$	1	39	<b>Decimate.</b> When $\overline{\text{DEC}}$ is LOW and $\overline{\text{INT}}$ is HIGH, the input data register runs at the full CLK rate. In this mode, the TMC2242A and TMC2242B decimate and output results at 1/2 the CLK rate.  When $\overline{\text{INT}} = \overline{\text{DEC}}$ , the TMC2242A is in equal rate mode. When both $\overline{\text{INT}}$ and $\overline{\text{DEC}}$ are HIGH, the TMC2242B is likewise in equal-rate mode, but when both $\overline{\text{INT}}$ and $\overline{\text{DEC}}$ are LOW, the TMC2242B interpolates with unity gain.  In equal-rate mode, the input and output sample rates equal the chip clock rate.
SYNC	43	37	<b>Synchronization.</b> Incoming data are synchronized by holding SYNC HIGH on CLK N-1 and LOW on CLK N when the first input data word is present on SI <sub>11-0</sub> . If $\overline{\text{DEC}} = \overline{\text{INT}} = 1$ (equal rate mode), SYNC is inactive. SYNC may be held LOW until resynchronization is desired, or it may be toggled at 1/2 the CLK rate.
CLK	42	36	<b>Clock.</b> The TMC2242A and TMC2242B operate from a single master clock. All internal registers, except the output register in decimation mode, are strobed on the rising edge of CLK. All timing parameters are referenced to the rising edge of CLK.
<b>Data Inputs</b>			
SI <sub>11-0</sub>	40, 37-30, 27-25	34, 31-24, 21-19	<b>Input Data Port.</b> A 12-bit 2's-complement input word is registered by the rising edge of CLK. In Interpolate Mode, SI <sub>11-0</sub> is registered on every other CLK (synchronized by SYNC). SI <sub>11</sub> is the MSB.
<b>Data Outputs</b>			
SO <sub>15-0</sub>	4-11, 14-21	42-44, 1-5, 8-15	<b>Output Data Port.</b> A 16-bit 2's-complement output result is available after the rising edge of CLK. In Decimate Mode, SO <sub>15-0</sub> is registered on every other CLK (synchronized by SYNC). SO <sub>15-0</sub> is rounded according to the state of RND <sub>2-0</sub> . SO <sub>15</sub> is the MSB.  The limiter circuitry ensures that for internal overflow, a valid full-scale output (7FFF or 8000) will be generated. With the TMC2242B in interpolate mode with -6dB gain, limits are 3FFF and C000 (TCO=1).
<b>Output Controls</b>			
$\overline{\text{OE}}$	3	41	<b>Output Enable.</b> When LOW, SO <sub>15-0</sub> are enabled. When HIGH, SO <sub>15-0</sub> are in a high-impedance state. $\overline{\text{OE}}$ is asynchronous with respect to CLK.
TCO	2	40	<b>Output Format.</b> When TCO is HIGH, output data are in signed 2's-complement format. When LOW, the output is inverted offset binary.
RND <sub>2-0</sub>	22-24	16-18	<b>Rounding Select.</b> These inputs set the position of the effective LSB of the output result. Outputs below the rounding bit are zeroed (Table 4).
<b>Power</b>			
VDD	13,29, 38	7, 23, 32	<b>Supply Voltage.</b> +5 Volt power inputs. These should come from the same power source and be decoupled to GND.
GND	12,28, 39,41	6, 22, 33, 35	<b>Ground.</b> Ground inputs should be connected to the system digital ground plane.

## Absolute Maximum Ratings

(beyond which the device may be damaged)<sup>1</sup>

Parameter	Conditions	Min	Max	Units
Supply Voltage		-0.5	7.0	V
Input Voltage		-0.5	V <sub>DD</sub> + 0.5	V
Output Applied Voltage <sup>2</sup>		-0.5	V <sub>DD</sub> + 0.5	V
Externally Forced Current <sup>3,4</sup>		-3.0	+6.0	mA
Short Circuit Duration	Single output in HIGH state to ground		1	sec
Operating Temperature (Case)		-20	110	°C
Junction Temperature			140	°C
Lead Soldering Temperature	10 seconds		300	°C
Storage Temperature		-65	150	°C

### Notes:

1. Functional operation under any of these conditions is NOT implied. Performance and reliability are guaranteed only if Operating Conditions are not exceeded.
2. Applied voltage must be current limited to specified range.
3. Forcing voltage must be limited to specified range.
4. Current is specified as conventional current flowing into the device.

SO15	SO14	SO13	...	SO8	SO7r	0	0	0	0	0	0	0	111

**Notes:**

1. A leading minus sign denotes the two's complement sign bit.
2. When TCO=0, the most significant bit of the output is positive instead of negative.
3. In all operating modes except  $\overline{\text{INT}} = 0$  and  $\overline{\text{DEC}} = 1$ , the gain is approximately unity. When  $\overline{\text{INT}} = 0$  and  $\overline{\text{DEC}} = 1$ , the output gain is -6 dB.
4. The "r" indicates that the trailing significant output bit has been rounded to the nearest 1/2 LSB. (Internally, the chip adds 1 to the next lower bit, to allow the user to obtain a properly rounded output)

### Applications Discussion

The TMC2242A and TMC2242B are well-suited for filtering digitized composite NTSC or PAL video. In Figure 10, the TMC1175A 8-bit video A/D converter outputs, D7-0, are connected to the TMC2242B inputs, SI11-4, respectively (grounding SI3-0). The RND2-0 controls are set to 111 for a 9-bit rounded decimated output on SO15-7.

In Figure 11, the TMC2242B drives a fast D/A converter to reconstruct analog composite video. The TMC3003 10-bit digital-to-analog converter inputs, D9-0 are connected to the TMC2242B outputs SO15-6, respectively. The TMC2242B RND2-0 controls are set to 110 for rounded 10-bit interpolation operation.

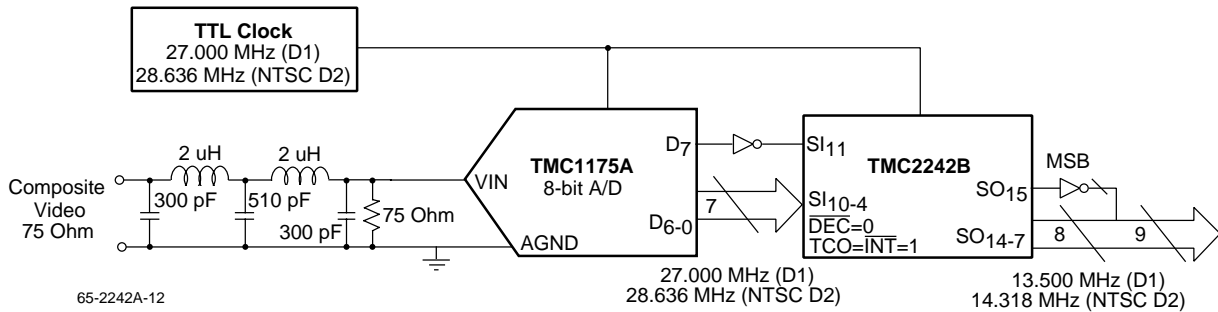

Figure 10. Decimating Oversampled Video With a Low Cost 8-bit A/D

Note: Data buses are unsigned binarys; TMC2242 input is two's complement.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
