

Advance Information

256K/512K Pipelined BurstRAM™ Secondary Cache Module for Pentium™

The MCM64PC32 (256K) and MCM64PC64 (512K) are designed to provide a burstable, high performance, L2 cache for the Pentium microprocessor in conjunction with Intel's Triton II chip set. The MCM64PC32 is configured as 32K x 64 bits and the MCM64PC64 is configured as 64K x 64 bits. Both are packaged in a 160 pin card edge memory module. Each module uses Motorola's 3.3 V 32K x 32 BurstRAMs and one Motorola 3.3 V 32K x 8 FSRAM for the tag RAM.

Bursts can be initiated with either address status processor (ADSP) or cache address status (CADS). Subsequent burst addresses are generated internal to the BurstRAM by the cache burst advance (CADV) input pin.

Write cycles are internally self timed and are initiated by the rising edge of the clock (CLK0) input. Eight write enables are provided for byte write control.

PD0 – PD3 map into the Triton II chip set for auto-configuration of the cache control.

- Pentium-Style Burst Counter on Chip
- Pipelined Data Out
- 160 Pin Card Edge Module
- Address Pipeline Supported by ADSP Disabled with $\bar{E}x$
- All Cache Data and Tag I/Os are TTL Compatible
- Three State Outputs
- Byte Write Capability
- Fast Module Clock Rate: 66 MHz
- Fast SRAM Access Times: 15 ns for Tag RAM
8 ns for Data RAMs
- One-Cycle Deselect Data RAMs
- Decoupling Capacitors for Each Fast Static RAM
- High Quality Multi-Layer FR4 PWB with Separate Power and Ground Planes
- Single 3.3 V +10%, - 5% Power Supply
- Burndy Connector, Part Number: CELP2X80SC3Z48
- Intel COAST 3.0 Option III Compliant
- Burst Order Select (BOSEL) Option

2. For a write operation following a read operation, G must be high before the input data required setup time and held high through the input data hold time.

DC ABSOLUTE MAXIMUM RATINGS (Voltages Referenced to $V_{SS} = 0\text{ V}$)

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{DD3}	- 0.5 to + 4.6	V
Voltage Relative to V_{SS}	V_{in}, V_{out}	$V_{SS} - 0.5$ to $V_{DD3} + 0.5$	V
Output Current (per I/O)	I_{out}	± 20	mA
Temperature Under Bias	T_{bias}	- 10 to + 85	°C
Operating Temperature	T_J	20 to +110	°C
Storage Temperature	T_{stg}	- 55 to + 125	°C

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.

This BiCMOS memory circuit has been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established.

This device contains circuitry that will ensure the output devices are in High-Z at power up.

NOTES:

1. Write applies to all SBx, SW, and SGW signals when the chip is selected and ADSP high.
2. Chip Enable applies to all SE1, SE2 and SE3 signals whenever ADSP or ADSC is asserted.
3. All read and write cycle timings are referenced from K or G.
4. G is a don't care after write cycle begins. To prevent bus contention, G should be negated prior to start of write cycle.
5. Tested per AC Test Load.
6. Measured at ± 200 mV from steady state. Tested per High-Z Test Load.
7. This parameter is sampled and is not 100% tested.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address setup time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

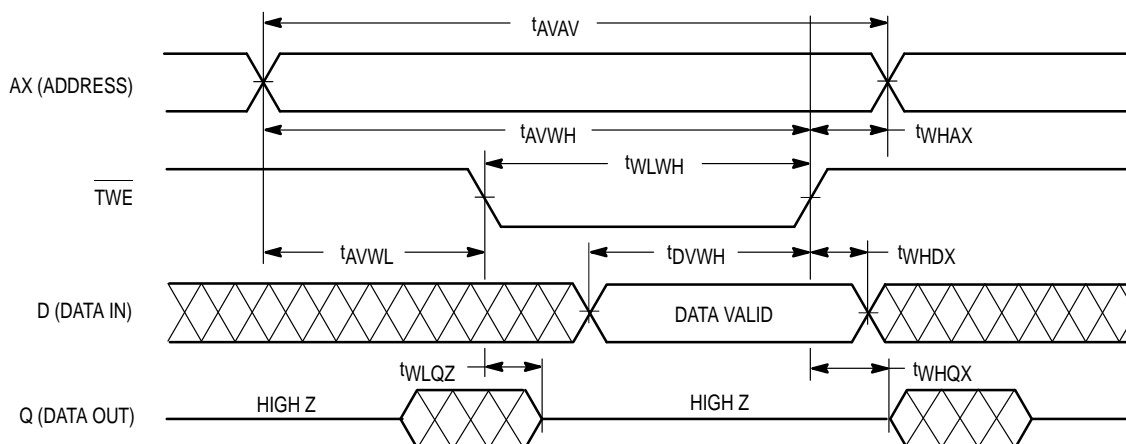

TAG RAM WRITE CYCLE (See Notes 1 and 2)

Parameter	Symbol	- 15		Unit	Notes
		Min	Max		
Write Cycle Time	t_{AVAV}	15	—	ns	3
Address Setup Time	t_{AVWL}	0	—	ns	
Address Valid to End of Write	t_{AVWH}	12	—	ns

Write High to Output Active	t_{WHQX}	4	—	ns	5,6,7
Write Recovery Time	t_{WHAX}	0	—	ns	

NOTES:

1. A write occurs when \overline{CWE} is low.
2. If \overline{CG} goes low coincident with or after \overline{CWE} goes low, the output will remain in a high impedance state.
3. All timings are referenced from the last valid address to the first address transition.
4. If $\overline{CG} \geq V_{IH}$, the output will remain in a high impedance state.
5. At any given voltage and temperature, t_{WLQZ} (max) is less than t_{WHQX} (min), both for a given device and from device to device.
6. Transition is measured ± 500 mV from steady-state voltage with load of Figure 3B.
7. This parameter is sampled and not 100% tested.
