# Digital Signal Processor (DSP) for cameras

## SAA8110G

### FEATURES

- High precision digital processing with 9 or 10 bit input
- Different types of CCDs (PAL, NTSC and CIF) (progressive, interlaced and non-interlaced)
- Black offset preprocessing (including optical black offset control)
- RGB-separation (with contour and white clip signals generation)
- RGB-processing (colour space matrix, black control, knee and gamma)
- RGB-to-YUV conversion (including down-sampling filters)
- White balance control
- Y-processing (contour processing, false colour detector, filters and noise reduction)
- UV-processing (false colour correction and noise reduction)
- Digital output formatter (including CIF-formatter, DTV2, D1)
- Analog output preprocessing (including PAL/NTSC-encoder and DACs)
- Measurement engine (prepared for auto-exposure and auto-white balance features)
- Miscellaneous functions (e.g. switched mode power supply pulse generator, control DAC)
- VH-reference and window timing
- Serial interface (selectable I<sup>2</sup>C-bus or 80C51 UART interface)
- Mode control (including power management).

### APPLICATIONS

- Desktop video applications
- Surveillance systems
- Video-phone systems.

### ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
SAA8110G	LQFP80	plastic low profile quad flat package; 80 leads; body 12 × 12 × 1.4 mm	SOT315-1

### GENERAL DESCRIPTION

The SAA8110G is designed for desktop video applications (teleconferencing, video grabbing), surveillance and video-phone systems.

The SAA8110G may be applied together with an analog front-end (TDA8786 including CDS/AGC/ADC), a timing generator and a microcontroller as shown in Figs 18 and 19. Other configurations are also possible.

The CCD-sensor can be of PAL, NTSC or CIF type (with complementary mosaic colour filter). The maximum number of active pixels is limited to 800 samples/line. The 10-bits digital input may have a pixel frequency of up to 14.318 MHz.

The SAA8110G output data is available in a digital and an analog output format. Two digital output formats are selectable: DTV2 (CCIR-601 at the input pixel frequency) and D1 (CCIR-656 at twice the input pixel frequency). It is also possible to generate the CIF and QCIF formats as subsets from the processed CCD-image. The analog output is available in one of four formats: RGB, YUV, YC or CVBS. The SAA8110G includes a digital PAL/NTSC-encoder and 3 DACs for this purpose.

Two types of serial interface are selectable: a fast 400 kHz I<sup>2</sup>C-bus interface or a 80C51 UART interface (with bit rates from 1 Mbit/s up to 3.75 Mbit/s depending on the system clock used). The power dissipation of the SAA8110G can be optimized for each application using the built-in power management function.

SYMBOL	PIN	I/O	DESCRIPTION
V <sub>DDA(DC)</sub>	41	I	analog supply for analog core of triple DAC
V <sub>SSA(BG)</sub>	42	I	analog ground for to band gap
DECOUPL	43	O	pin to be used for external decoupling of band gap
RBIAS	44	O	external bias resistor connection for band gap
V <sub>DDA(BG)</sub>	45	I	analog supply for band gap
V <sub>DDD(P1)</sub>	46	I	digital supply 1 for CLK2 related peripherals
CLK2	47	I	output clock (CLK2 frequency is 2 × CLK1 frequency)
FI <sub>OUT</sub>	48	O	field identification output pulse
VSYNC <sub>OUT</sub>	49	O	vertical synchronization output
HREF	50	O	horizontal reference output for YUV-port
CREF/PXQ	51	O	clock/pixel qualifier output for YUV-port
LLC	52	O	line-locked system clock output
V <sub>SSD(P1)</sub>	53	I	digital ground 1 for CLK2 related peripherals
UV7	54	O	multiplex chrominance UV bit 7 (MSB)
UV6	55	O	multiplex chrominance UV bit 6
UV5	56	O	multiplex chrominance UV bit 5
UV4	57	O	multiplex chrominance UV bit 4
UV3	58	O	multiplex chrominance UV bit 3
UV2	59	O	multiplex chrominance UV bit 2
UV1	60	O	multiplex chrominance UV bit 1
UV0	61	O	multiplex chrominance UV bit 0 (LSB)
V <sub>DDD(P2)</sub>	62	I	digital supply for CLK2 related peripherals
Y7	63	O	luminance Y or multiplexed YUV bit 7 (MSB)
Y6	64	O	luminance Y or multiplexed YUV bit 6
Y5	65	O	luminance Y or multiplexed YUV bit 5
Y4	66	O	luminance Y or multiplexed YUV bit 4
Y3	67	O	luminance Y or multiplexed YUV bit 3
Y2	68	O	luminance Y or multiplexed YUV bit 2
Y1	69	O	luminance Y or multiplexed YUV bit 1
Y0	70	O	luminance Y or multiplexed YUV bit 0 (LSB)
V <sub>SSD(P2)</sub>	71	I	digital ground 2 for to CLK2 related peripherals
V <sub>DDD(C3)</sub>	72	I	digital supply 3 for digital core and CLK1 related peripherals
A1/SN <sub>RES</sub>	73	I	I <sup>2</sup> C-bus address select pin A1 or SNERT reset input
A0/SN <sub>DA</sub>	74	I	I <sup>2</sup> C-bus address select pin A0 or SNERT data input/output
SDA	75	I	I <sup>2</sup> C-bus data input/output
V <sub>SSD(C3)</sub>	76	I	digital ground 3 for digital core and CLK1 related peripherals
SCL/SN <sub>CL</sub>	77	I	I <sup>2</sup> C-bus clock/SNERT clock input
V <sub>SSD(C4)</sub>	78	I	digital ground 4 for digital core and CLK1 related peripherals
X <sub>IN</sub>	79	I	input crystal oscillator for subcarrier lock applications
X <sub>OUT</sub>	80	O	output crystal oscillator for subcarrier lock applications

Fig.2 Pin configuration.

# Digital Signal Processor (DSP) for cameras

## SAA8110G

### FUNCTIONAL DESCRIPTION

#### Black offset preprocessing

The input data is clamped within the optical black pixel area of the CCD. The size of the digital clamp window is 16 pixels by 128 lines (i.e. TDA8786). It is possible to differentiate black levels for odd/even lines, pixels and fields. This comes in addition to the analog preprocessing clamp which is active on the clamp pulse generated by the external timing circuit. The analog clamp is included in the TDA8786.

#### RGB separation

PAL/NTSC sensors generate interlaced data adding offset in the complementary colour pixels. The RGB separation block with its two line memories generates the three components Y, 2R – G, and 2B – G for each input data corresponding to a pixel value of the CCD. Then the triplet R, G, B is derived. This block also delivers some contour and white clip information.

#### RGB processing

The RGB processing includes several features:

- Colour space matrix depending on CCD type to be suitable with different sensor colour filters
- Gain correction for R and B signals for white balance control
- Black offset
- Adjustable knee
- Adjustable gamma function.

The knee function is applied to all three RGB signals. Its shape is continuously adjustable by changing the slope and the knee offset point.

To compensate for the non-linear response of display devices, a gamma correction is applied to R, G and B signals. It may be adjustable from linear to a 0.35 power coefficient.

Fig.3 RGB separation diagram.

Fig.4 RGB processing.

# Digital Signal Processor (DSP) for cameras

## SAA8110G

### RGB-to-YUV block

After RGB processing, the channels are separated in a luminance and two colour difference path:  
 $Y = 0.299 R + 0.597 G + 0.114 B$ ,  $U = 0.49 (B - Y)$  and  $V = 0.88 (R - Y)$ . It also contains two down-sampling filters for U and V signals.

- Contour correction allowing an increase of the luminance transitions for a sharper picture
- Black stretch function for contrast enhancement in dark scenes
- False colour detector used by the UV-processing block to enable the colour killer
- Filters and noise reduction by coring (only in the high frequency part of the signal).

### Y-processing

The luminance component includes several features:

Fig.5 RGB-to-YUV conversion.

Fig.6 Y processing.

# Digital Signal Processor (DSP) for cameras

SAA8110G

Fig.7 UV-processing.

### UV-processing

The chrominance component includes several features:

- Noise reduction for high frequencies
- False colour correction: a colour killer cuts the false colour components in the UV signals
- UV-gain control used to set the correct UV levels for PAL/NTSC encoding.

As the colour filter saturation levels may be different in the CCD, the white clip is used in the UV-processing to suppress colour errors in case of high exposure.

### Digital output formatter

This block contains several features:

- Generation of a synchronous clock LLC (twice the clock frequency)
- Generation of three synchronization signals (HREF, CREF and VS)
- Synchronization of the output data to the output clock LLC
- Generation of a CIF/QCIF output format for several type of sensors (see Table 1)
- Selection of the required digital output format (8-bit multiplexed YUV standard D1/CCIR 656, including the generator of SAV/EAV codes or 16-bit multiplexed YUV 4 : 2 : 2 standard DTV2/CCIR601).

Note that the D1 frequency data rate is twice the DTV2 frequency data rate.

Moreover, using a high resolution PAL and NTSC CCDs, it is possible to generate the following formats by means of cutting or down-sampling.

- CIF 352 × 288 at 25 frame/second and CIF 352 × 240 at 30 frame/second
- QCIF 176 × 144 at 25 frame/second and QCIF 176 × 120 at 30 frame/second.

**Table 1** CIF/QCIF output format for different sensor types

INPUT FORMAT	OUTPUT FORMAT	
PAL/NTSC-sensor	CIF	'full screen'
	CIF	'zoom-by-2'
	QCIF	'full screen'
	QCIF	'zoom-by-2'
	QCIF	'zoom-by-4'
CIF	QCIF	'full screen'

## SAA8110G

### Analog output preprocessing

This block contains several features:

- Delay compensation for the luminance signal
- Up-sampling of the UV signal
- PAL/NTSC encoding
- YUV to RGB conversion
- Selection of the required analog output format (RGB, YUV, YC or CVBS).

The analog outputs are given by three voltage DACs in RGB or YUV or CVBS or YC format. Channels Y and G include the sync information. Over-sampling at twice  $f_{clk}$  is made so that external filtering becomes easier. It is also possible to have an adjustment of the subcarrier via the serial interface. When CVBS output is used, chrominance range is halved compared to luminance.

### Measurement engine

The measurement engine performs measurements on some selectable internal signals on frame/field basis and prepares data for auto exposure, auto focus and auto white balance processing. It uses an internal RAM work-space for its control and data handling operations. The contents of the work-space can be accessed via the serial interface.

### Vertical/horizontal reference and window timing and control

The SAA8110G uses two vertical and horizontal synchronization input signals ( $VSYNC_{IN}$  and  $HSYNC_{IN}$ ) to derive internal vertical and horizontal reference signals. Besides a Field Identification input ( $FI_{IN}$ ) signal is required. The timing of the vertical and horizontal input signals should be such that:

1. The pixel frequency (CLK1) must be line-locked to the line frequency of  $HSYNC_{IN}$ : the number of clock periods between two  $HSYNC_{IN}$  pulses must be a fixed integer number. The  $HSYNC_{IN}$  should be at least one clock period active HIGH.
2. The  $VSYNC_{IN}$  signal indicates the start of a field (or frame in case of progressive scanning); this signal is also required for non-interlaced applications. The  $VSYNC_{IN}$  should be at least one clock period HIGH.
3. The  $FI_{IN}$  pulse indicates the phase of the field in case of interlaced applications ( $FI_{IN} = 0$  means odd field).

### Serial interface

The serial interface can either be an I<sup>2</sup>C-bus or a 80C51 UART (SNERT) (selectable with the SIS pin). Via the serial interface the external microcontroller can control the internal settings of the SAA8110G and read/write from/to the internal RAM work-space linked to the measurement engine (see list of parameter settings in Chapter "Programming"). Some of the registers are double-buffered to prevent that the change of control data becomes visible on the output display.

### Miscellaneous functions

A three wire bus is used to send 10-bit settings from a microcontroller to the TDA8786 via the SAA8110G registers. The SAA8110G supplies picture parameters and needs some configuration parameters. Those values are contained in registers and are updated during every vertical synchronization pulse.

### Mode control

This block controls the operation mode of the SAA8110G. As described in Table 2, four modes may be selected: depending on power reduction and I<sup>2</sup>C-bus timing.

### Power dissipation management

The power dissipation of the SAA8110G will depend on the required activity for a certain application. It is possible to switch off via the serial interface unconcerned parts for a given application. When an analog output is not used, the power voltage pin of the DAC can be connected to ground to limit the power consumption.

### Clock configurations

Following conditions must be fulfilled:

- CLK1 should be generated as divide-by-two from CLK2
- The RESET pin should not go LOW before CLK1 and CLK2 are both HIGH or LOW.

**Table 2** SAA8110G mode control

T2	T1	T0	MODE	POWER REDUCTION	t <sub>o(h)</sub> I <sup>2</sup> C-BUS
0	0	0	application mode	on	short
0	0	1		on	long
0	1	0		off	short
0	1	1		off	long

## SAA8110G

**Table 3** Sensor and output formats covered by the SAA8110G

CCD-formats			RESOLUTION		PIXEL FREQUENCY (MHz)	OUTPUT FORMATS		
STANDARD	FRAME SCANNING AND FREQUENCY (Hz)		ACTIVE H/V	TOTAL H/V		DIGITAL		ANALOG
					DTV2/D1	CIF		
CIF	non-interlaced	60	352/243	429/262	6.75	no	yes	yes
CIF	non-interlaced	50	352/288	432/312	6.75	no	yes	yes
NTSC high resolution	non-interlaced	60.054	768/243	910/262	14.3181	yes	yes	yes
	interlaced	29.997	768/494	910/525				
PAL high resolution	non-interlaced	50	752/288	908/312	14.1875	yes	yes	yes
	interlaced	25	752/582	908/625				
NTSC medium resolution	non-interlaced	60	512/243	606/262	9.53495	yes	no	yes
	interlaced	30	512/492	606/525				
PAL medium resolution	non-interlaced	50	512/288	618/312	9.65625	yes	no	yes
	interlaced	25	512/582	618/625				

### LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC134).

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V <sub>DDD</sub>	digital supply voltage	-0.3	+7.0	V
V <sub>DDA</sub>	analog supply voltage	-0.3	+7.0	V
ΔV <sub>DDD-DDA</sub>	supply voltage difference between the digital and the analog supply voltages	-0.1	+0.1	V
V <sub>I</sub>	input voltage	-0.3	V <sub>DD</sub> + 0.3	V
V <sub>O</sub>	output voltage	-0.3	V <sub>DD</sub> + 0.3	V
P <sub>tot</sub>	total allowed power dissipation at T <sub>amb</sub> = 75 °C	-	1	W
T <sub>stg</sub>	storage temperature	-55	+150	°C
T <sub>j</sub>	junction temperature	-	125	°C

### HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices.

### THERMAL CHARACTERISTICS

## Notes

1. When CVBS output is used the chrominance range is halved compared to luminance.
2. Monitor load of 75  $\Omega$  with  $R_{ext} = 21\ \Omega$  and  $R_{bias} = 15\text{ k}\Omega$  at 3.3 V application.
3. Monitor load of 75  $\Omega$  with  $R_{ext} = 70.6\ \Omega$  and  $R_{bias} = 47\text{ k}\Omega$  at 5.0 V application.

## SAA8110G

### APPLICATION INFORMATION

TDA8786 and SAA8110G can be used with Sharp CCDs. TDA8786A and SAA8110G can be used with Sony CCDs. Table 27 gives as an example some references of ICs which may be used with Philips TDA8786(A)/SAA8110G. This overview is not restrictive, both devices are compatible with other CCD/V-driver/PPG combinations including the more recent ones.

**Table 27** Possible components for the application of Figs 18 and 19.

CCD TYPE	COMPONENT TYPE	NTSC		PAL	
		MEDIUM RESOLUTION	HIGH RESOLUTION	MEDIUM RESOLUTION	HIGH RESOLUTION
SONY CCDs	CCD	LZ2313H5	LZ2353A	LZ2323H5	LZ2363
	V-driver	LR36683N			
	timing generator	LZ95G55	LZ95G71	LZ95G55	LZ95G71
SHARP CCDs	CCD	ICX056AK	ICX068AK	ICX057AK	ICX069AK
	V-driver	CXD1250MN; CXD1267N			
	timing generator	CXD1257AR	CXD1265R	CXD1257AR	CXD1265R

### Notes to the application diagram

- In the configuration of Figs 18 and 19, the microcontroller reads and writes data from/to the DSP using the SNERT-bus (UART-mode 0). Optional external control is available through the I<sup>2</sup>C-bus.
- Free I/O pins of the microcontroller can be used to control PGG, or for other purposes.
- 83Cxxx processing is synchronized by VD interruption. Depending on VD polarity, it can be necessary to invert VD.
- A customized 83Cxxx is available for this application. Please contact your nearest Philips sales office.

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

#### Reflow soldering

Reflow soldering techniques are suitable for all LQFP packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

#### Wave soldering

Wave soldering is **not** recommended for LQFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.**

**Even with these conditions, do not consider wave soldering LQFP packages LQFP48 (SOT313-2), LQFP64 (SOT314-2) or LQFP80 (SOT315-1).**

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

**DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

**PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS**

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
