

SYNCHRONOUS BURST SRAM

128K x 18 SRAM

**+3.3V POWER SUPPLY ,
REGISTERED INPUTS, BURST COUNTER**

FEATURES

- Fast access times: 8, 8.5, 10, and 11ns
- Fast clock speed: 100, 90, and 67 MHz
- Provide high performance 2-1-1-1 access rate
- Fast OE# access times: 3.5, 4.0, 4.5, and 5.0ns
- 3.3V -5% and +10% power supply
- Separate isolated output buffer supply compatible with 3.3V and 2.5V I/O (VCCQ): 2.375V to 3.6V
- 5V tolerant inputs except I/O's
- Clamp diodes to VSS/VSSQ at all inputs and outputs
- Common data inputs and data outputs
- BYTE WRITE ENABLE and GLOBAL WRITE control
- Three chip enables for depth expansion and address pipeline
- Address, data and control registers
- Internally self-timed WRITE CYCLE
- Burst control pins (interleaved or linear burst sequence)
- Automatic power-down for portable applications
- High density, high speed packages

OPTIONS

- Timing
 - 8ns access/10ns cycle
 - 8.5ns access/11ns cycle
 - 10ns access/15ns cycle
 - 11ns access/15ns cycle
- Packages
 - 100-pin TQFP

GENERAL DESCRIPTION

The Galvantech Synchronous Burst SRAM family employs high-speed, low power CMOS designs using advanced triple-layer polysilicon, double-layer metal technology. Each memory cell consists of four transistors and two high valued resistors.

The GVT71128B18 SRAM integrates 131,072x18 SRAM cells with advanced synchronous peripheral circuitry and a 2-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip enable (CE#), depth-expansion chip enables (CE2# and CE2), burst control inputs (ADSC#, ADSP#, and ADV#), write enables (WEL#, WEH#, and BWE#), and global write (GW#).

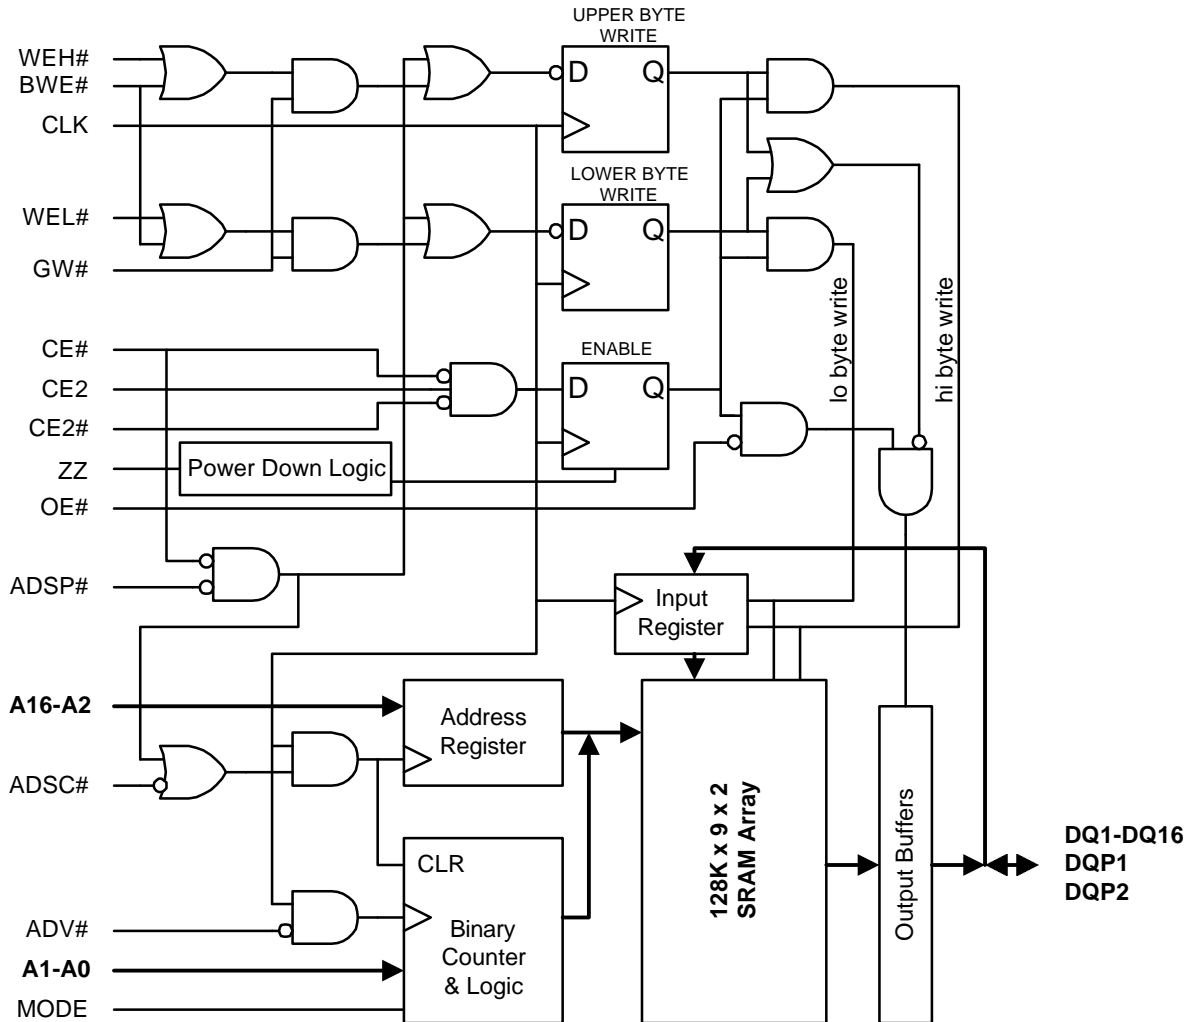

Asynchronous inputs include the output enable (OE#), burst mode control (MODE), and sleep mode control (ZZ). The data outputs (DQ), enabled by OE#, are also asynchronous.

Addresses and chip enables are registered with either address status processor (ADSP#) or address status controller (ADSC#) input pins. Subsequent burst addresses can be internally generated as controlled by the burst advance pin (ADV#).

Address, data inputs, and write controls are registered on-chip to initiate self-timed WRITE cycle. WRITE cycles can be one or two bytes wide as controlled by the write control inputs. Individual byte enables allow individual bytes to be written. WEL# controls DQ1-DQ8 and DQP1. WEH# controls DQ9-DQ16 and DQP2. WEL# and WEH# can be active only with BWE# being LOW. GW# being LOW causes all bytes to be written.

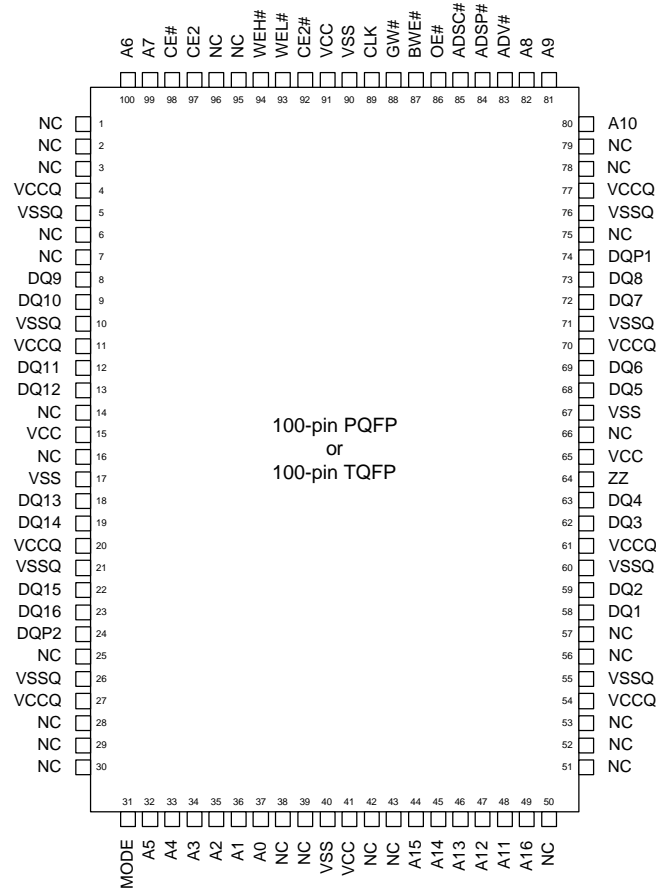

The GVT71128B18 operates from a +3.3V power supply. All inputs and outputs are TTL-compatible. The device is ideally suited for 486, Pentium™, 680x0, and PowerPC™ systems and for systems that are benefited from a wide synchronous data bus.

FUNCTIONAL BLOCK DIAGRAM

NOTE: The Functional Block Diagram illustrates simplified device operation. See Truth Table, pin descriptions and timing diagrams for detailed information.

PIN ASSIGNMENT (Top View)

PIN DESCRIPTIONS

QFP PINS	SYMBOL	TYPE	DESCRIPTION
37, 36, 35, 34, 33, 32, 100, 99, 82, 81, 80, 48, 47, 46, 45, 44, 49	A0-A16	Input-Synchronous	Addresses: These inputs are registered and must meet the setup and hold times around the rising edge of CLK. The burst counter generates internal addresses associated with A0 and A1, during burst cycle and wait cycle.
93, 94	WEL#, WEH#	Input-Synchronous	Byte Write Enables: A byte write enable is LOW for a WRITE cycle and HIGH for a READ cycle. WEL# controls DQ1-DQ8 and DQP1. WEH# controls DQ9-DQ16 and DQP2. Data I/O are high impedance if either of these inputs are LOW, conditioned by BWE# being LOW.
87	BWE#	Input-Synchronous	Write Enable: This active LOW input gates byte write operations and must meet the setup and hold times around the rising edge of CLK.
88	GW#	Input-Synchronous	Global Write: This active LOW input allows a full 18-bit WRITE to occur independent of the BWE# and WEn# lines and must meet the setup and hold times around the rising edge of CLK.
89	CLK	Input-Synchronous	Clock: This signal registers the addresses, data, chip enables, write control and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
98	CE#	Input-Synchronous	Chip Enable: This active LOW input is used to enable the device and to gate ADSP#.
92	CE2#	Input-Synchronous	Chip Enable: This active LOW input is used to enable the device.

PIN DESCRIPTIONS (continued)

QFP PINS	SYMBOL	TYPE	DESCRIPTION
97	CE2	input-Synchronous	Chip enable: This active HIGH input is used to enable the device.
86	OE#	Input	Output Enable: This active LOW asynchronous input enables the data output drivers.
83	ADV#	Input-Synchronous	Address Advance: This active LOW input is used to control the internal burst counter. A HIGH on this pin generates wait cycle (no address advance).
84	ADSP#	Input-Synchronous	Address Status Processor: This active LOW input, along with CE# being LOW, causes a new external address to be registered and a READ cycle is initiated using the new address.
85	ADSC#	Input-Synchronous	Address Status Controller: This active LOW input causes device to be de-selected or selected along with new external address to be registered. A READ or WRITE cycle is initiated depending upon write control inputs.
31	MODE	Input-Static	Mode: This input selects the burst sequence. A LOW on this pin selects LINEAR BURST. A NC or HIGH on this pin selects INTERLEAVED BURST.
64	ZZ	Input-Asynchronous	Snooze: This active HIGH input puts the device in low power consumption standby mode. For normal operation, this input has to be either LOW or NC (No Connect).
58, 59, 62, 63, 68, 69, 72, 73, 8, 9, 12, 13, 18, 19, 22, 23	DQ1-DQ16	Input/Output	Data Inputs/Outputs: Low Byte is DQ1-DQ8. High Byte is DQ9-DQ16. Input data must meet setup and hold times around the rising edge of CLK.
74, 24	DQP1, DQP2	Input/Output	Parity Inputs/Outputs: DQP1 is parity bit for DQ1-DQ8 and DQP2 is parity bit for DQ9-DQ16.
15, 41, 65, 91	VCC	Supply	Power Supply: +3.3V -5% and +10%
17, 40, 67, 90	VSS	Ground	Ground: GND.
4, 11, 20, 27, 54, 61, 70, 77	VCCQ	I/O Supply	Output Buffer Supply: +2.375 to 3.6V
5, 10, 21, 26, 55, 60, 71, 76	VSSQ	I/O Ground	Output Buffer Ground: GND
1-3, 6, 7, 14, 16, 25, 28-30, 38, 39, 42, 43, 51-50, 53, 56, 57, 66, 75, 78, 79, 80, 95, 96	NC	-	No Connect: These signals are not internally connected.

WRITE Cycle, Suspend Burst	Current	H	X	X	X	H	H	L	X	L-H	D

- Note:
1. X means "don't care." H means logic HIGH. L means logic LOW. WRITE# = L means [BWE# + WEL#*WEH#]*GW# equals LOW. WRITE# = H means [BWE# + WEL#*WEH#]*GW# equals HIGH.
 2. WEL# enables write to DQ1-DQ8 and DQP1. WEH# enables write to DQ9-DQ16 and DQP2.
 3. All inputs except OE# must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
 4. Suspending burst generates wait cycle.
 5. For a write operation following a read operation, OE# must be HIGH before the input data required setup time plus High-Z time for OE# and staying HIGH throughout the input data hold time.
 6. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
 7. ADSP# LOW along with chip being selected always initiates an READ cycle at the L-H edge of CLK. A WRITE cycle can be performed by setting WRITE# LOW for the CLK L-H edge of the subsequent wait cycle. Refer to WRITE timing diagram for clarification.

NOTES

- All voltages referenced to VSS (GND).
- Overshoot: $V_{IH} \leq +6.0V$ for $t \leq {}^tKC / 2$.
Undershoot: $V_{IL} \leq -2.0V$ for $t \leq {}^tKC / 2$
- I_{cc} is given with no output current. I_{cc} increases with greater output loading and faster cycle times.
- This parameter is sampled.
- Test conditions as specified with the output loading as shown in Fig. 1 unless otherwise noted.
- Output loading is specified with $CL=5pF$ as in Fig. 2.
- At any given temperature and voltage condition, tKQHZ is less than tKQLZ and tOEHZ is less than tOELZ .
- A READ cycle is defined by byte write enables all HIGH or ADSP# LOW along with chip enables being active for the required setup and hold times. A WRITE cycle is defined by at one byte or all byte WRITE per READ/WRITE TRUTH TABLE.
- OE# is a "don't care" when a byte write enable is sampled LOW.
- This is a synchronous device. All synchronous inputs must meet specified setup and hold time, except for "don't care" as defined in the truth table.
- AC I/O curves are available upon request.
- "Device Deselected" means the device is in POWER -DOWN mode as defined in the truth table. "Device Selected" means the device is active.
- Typical values are measured at 3.3V, 25°C and 20ns cycle time.
- MODE pin has an internal pull-up and ZZ pin has an internal pull-down. These two pins exhibit an input leakage current of $\pm 30 \mu A$.

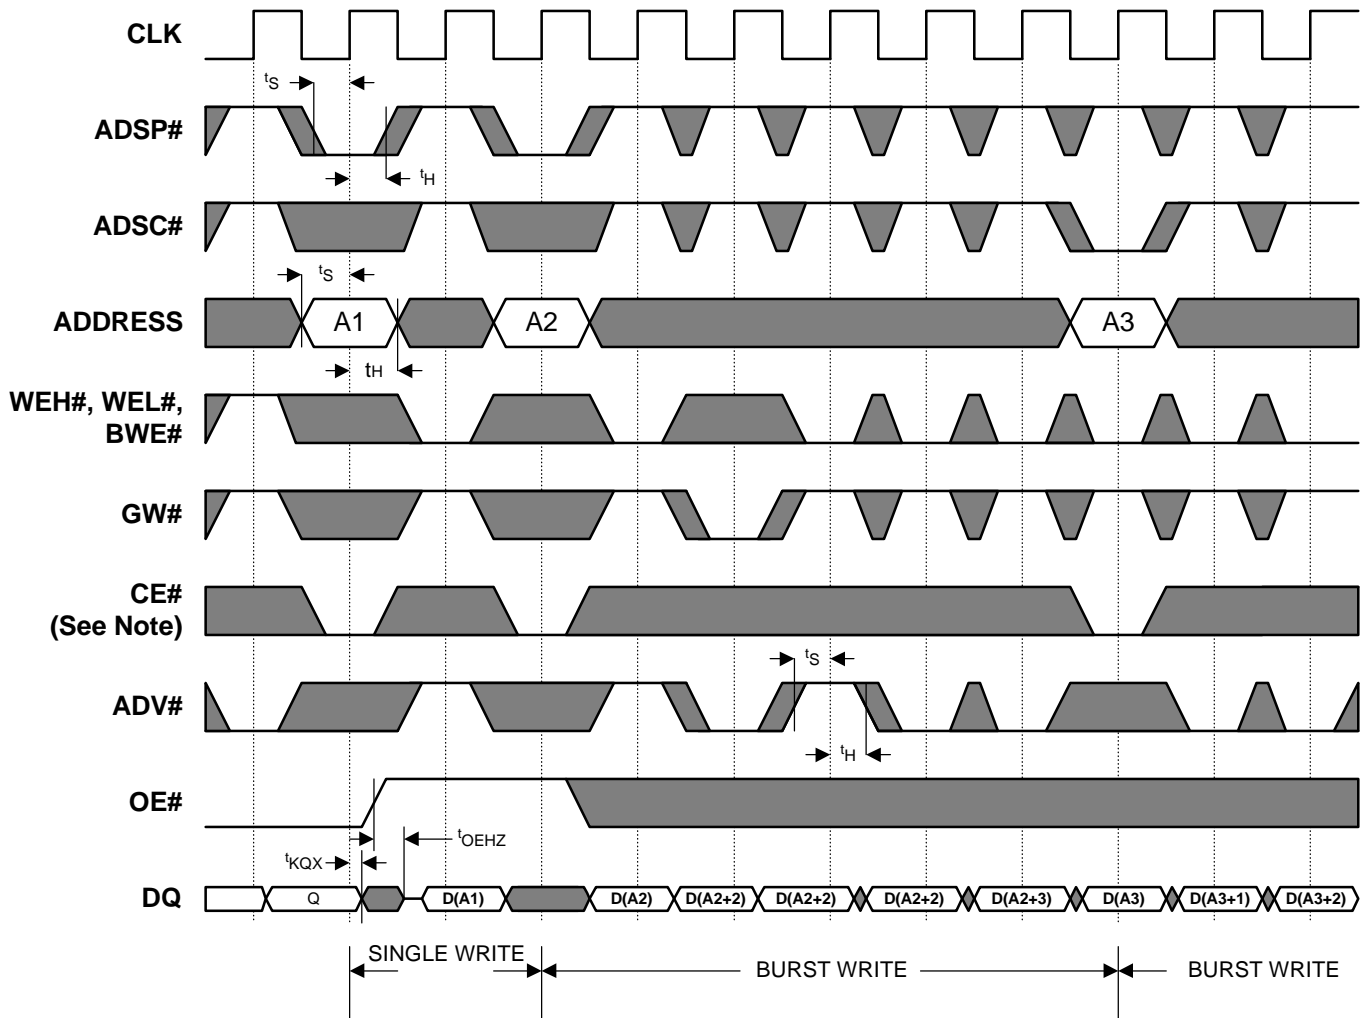

- Capacitance derating applies to capacitance different from the load capacitance shown in Fig. 1.

READ TIMING

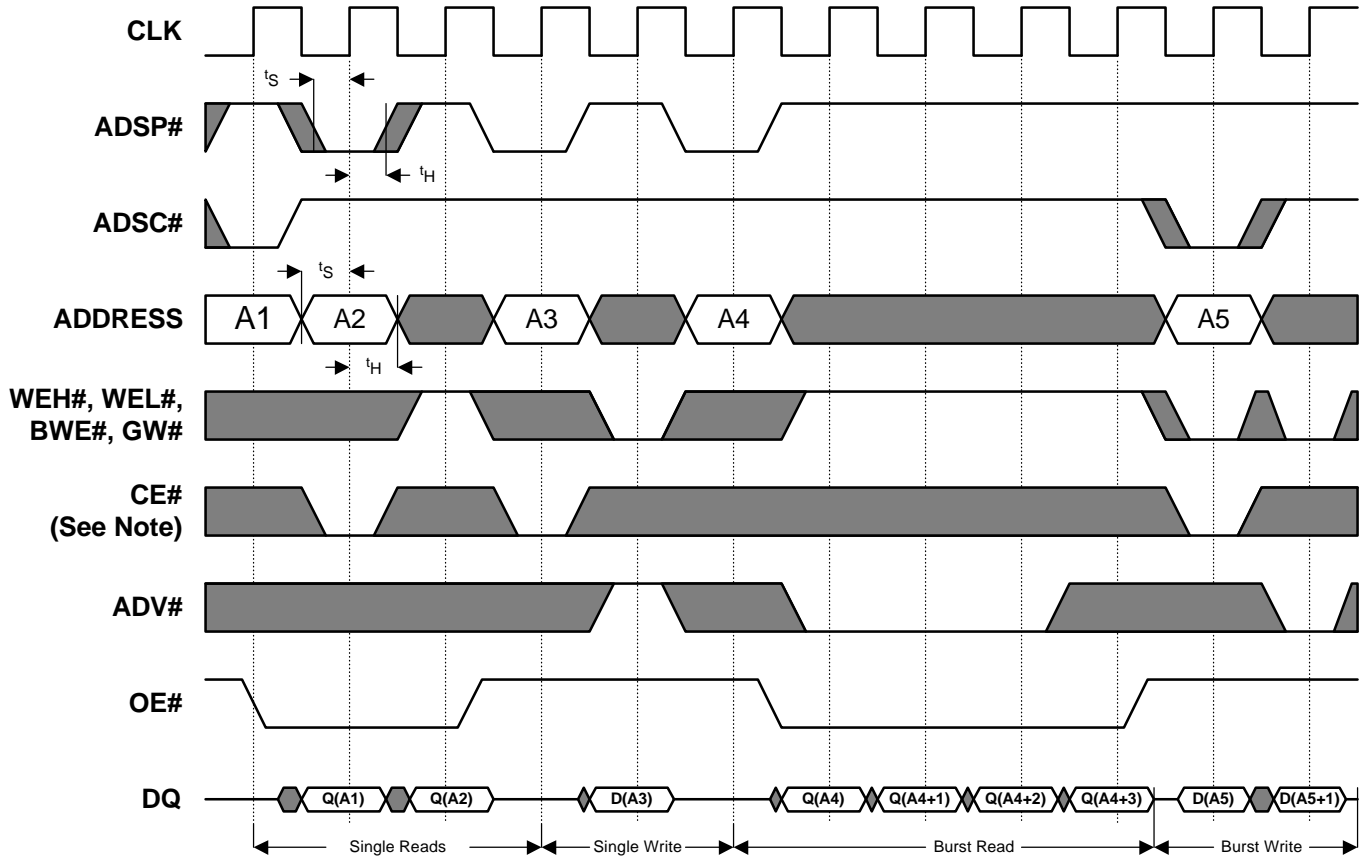

Note: CE# active in this timing diagram means that all chip enables CE#, CE2, and CE2# are active.

WRITE TIMING

Note: CE# active in this timing diagram means that all chip enables CE#, CE2, and CE2# are active.

READ/WRITE TIMING

Note: CE# active in this timing diagram means that all chip enables CE#, CE2, and CE2# are active.
