**GENERAL DESCRIPTION**

The Samsung KMM5362205C2W is a 2Mx36bits Dynamic RAM high density memory module. The Samsung KMM5362205C2W consists of four CMOS 1Mx16bits DRAMs in 42-pin SOJ package and two CMOS 1Mx4 bit Quad CAS with EDO DRAM in 24-pin SOJ package mounted on a 72-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM. The KMM5362205C2W is a Single In-line Memory Module with edge connections and is intended for mounting into 72 pin edge connector sockets.

## NOTES

- An initial pause of 200us is required after power-up followed by any 8  $\overline{\text{RAS}}$ -only or  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycles before proper device operation is achieved.
- V<sub>IH</sub>(min) and V<sub>IL</sub>(max) are reference levels for measuring timing of input signals. Transition times are measured between V<sub>IH</sub>(min) and V<sub>IL</sub>(max) and are assumed to be 5ns for all inputs.
- Measured with a load equivalent to 2 TTL loads and 100pF.
- Operation within the t<sub>RCD</sub>(max) limit insures that t<sub>RAC</sub>(max) can be met. t<sub>RCD</sub>(max) is specified as a reference point only. If t<sub>RCD</sub> is greater than the specified t<sub>RCD</sub>(max) limit, then access time is controlled exclusively by t<sub>CAC</sub>.
- Assumes that t<sub>RCD</sub> ≥ t<sub>RCD</sub>(max).
- This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V<sub>OH</sub> or V<sub>OL</sub>.
- t<sub>WCS</sub> is non-restrictive operating parameter. It is included in the data sheet as electrical characteristics only. If t<sub>WCS</sub> ≥ t<sub>WCS</sub>(min), the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.
- Either t<sub>RCH</sub> or t<sub>RRH</sub> must be satisfied for a read cycle.
- These parameters are referenced to the  $\overline{\text{CAS}}$  leading edge in early write cycles and to the  $\overline{\text{W}}$  leading edge in read-write cycles.
- Operation within the t<sub>TRAD</sub>(max) limit insures that t<sub>TRAC</sub>(max) can be met. t<sub>TRAD</sub>(max) is specified as reference point only. If t<sub>TRAD</sub> is greater than the specified t<sub>TRAD</sub>(max) limit, then access time is controlled by t<sub>AA</sub>.
- t<sub>CEZ</sub>(max), t<sub>REZ</sub>(max), t<sub>WEZ</sub>(max) and t<sub>OEZ</sub>(max) define the time at which the output achieves the open circuit condition and are not referenced to output voltage level.
- If  $\overline{\text{RAS}}$  goes to high before  $\overline{\text{CAS}}$  high going, the open circuit condition of the output is achieved by  $\overline{\text{CAS}}$  high going. If  $\overline{\text{CAS}}$  goes to high before  $\overline{\text{RAS}}$  high going, the open circuit condition of the output is achieved by  $\overline{\text{RAS}}$  high going.
- t<sub>ASC</sub> ≥ t<sub>CP</sub> min
- In order to hold the address latched by the first  $\overline{\text{CAS}}$  going low, the parameter t<sub>CLCH</sub> must be met.
