

## SUMMARY

The KB2516 is a triple 8-bit analog-to-digital converter optimized for digitizing R/G/B graphics signal from PC and workstation. Its 140MSPS encode rate capability and analog bandwidth of 500MHz supports support display resolution of up to SXGA (1280 × 1024) class. The IC also includes a PLL (Phase Locked Loop) system that can be locked on horizontal line frequency, and generates the ADC clock.

## FEATURES

- Analog bandwidth of 500MHz
- 3 clamps for 256 programmable levels
- 3 programmable gain amplifiers
- Analog input range: 0.5Vpp to 1.0Vpp
- Triple 8-bit ADC
- Sampling rate up to 140MHz
- Fully integrated PLL to generate the ADC clock, which can be locked to a HSYNC
- Integrated PLL divider
- Programmable clock phase control ( $\Phi_{step} = 7.5^\circ$ )  
Integrated SOG separator and HSYNC input polarity detector
- Single and double pixel width output data bus
- Support I<sup>2</sup>C and 3-wire serial interface
- Power down mode
- 1.25W power dissipation

## ORDERING INFORMATION

Device	Package	Ordering Information
KB2516	144-LQFP-2020	

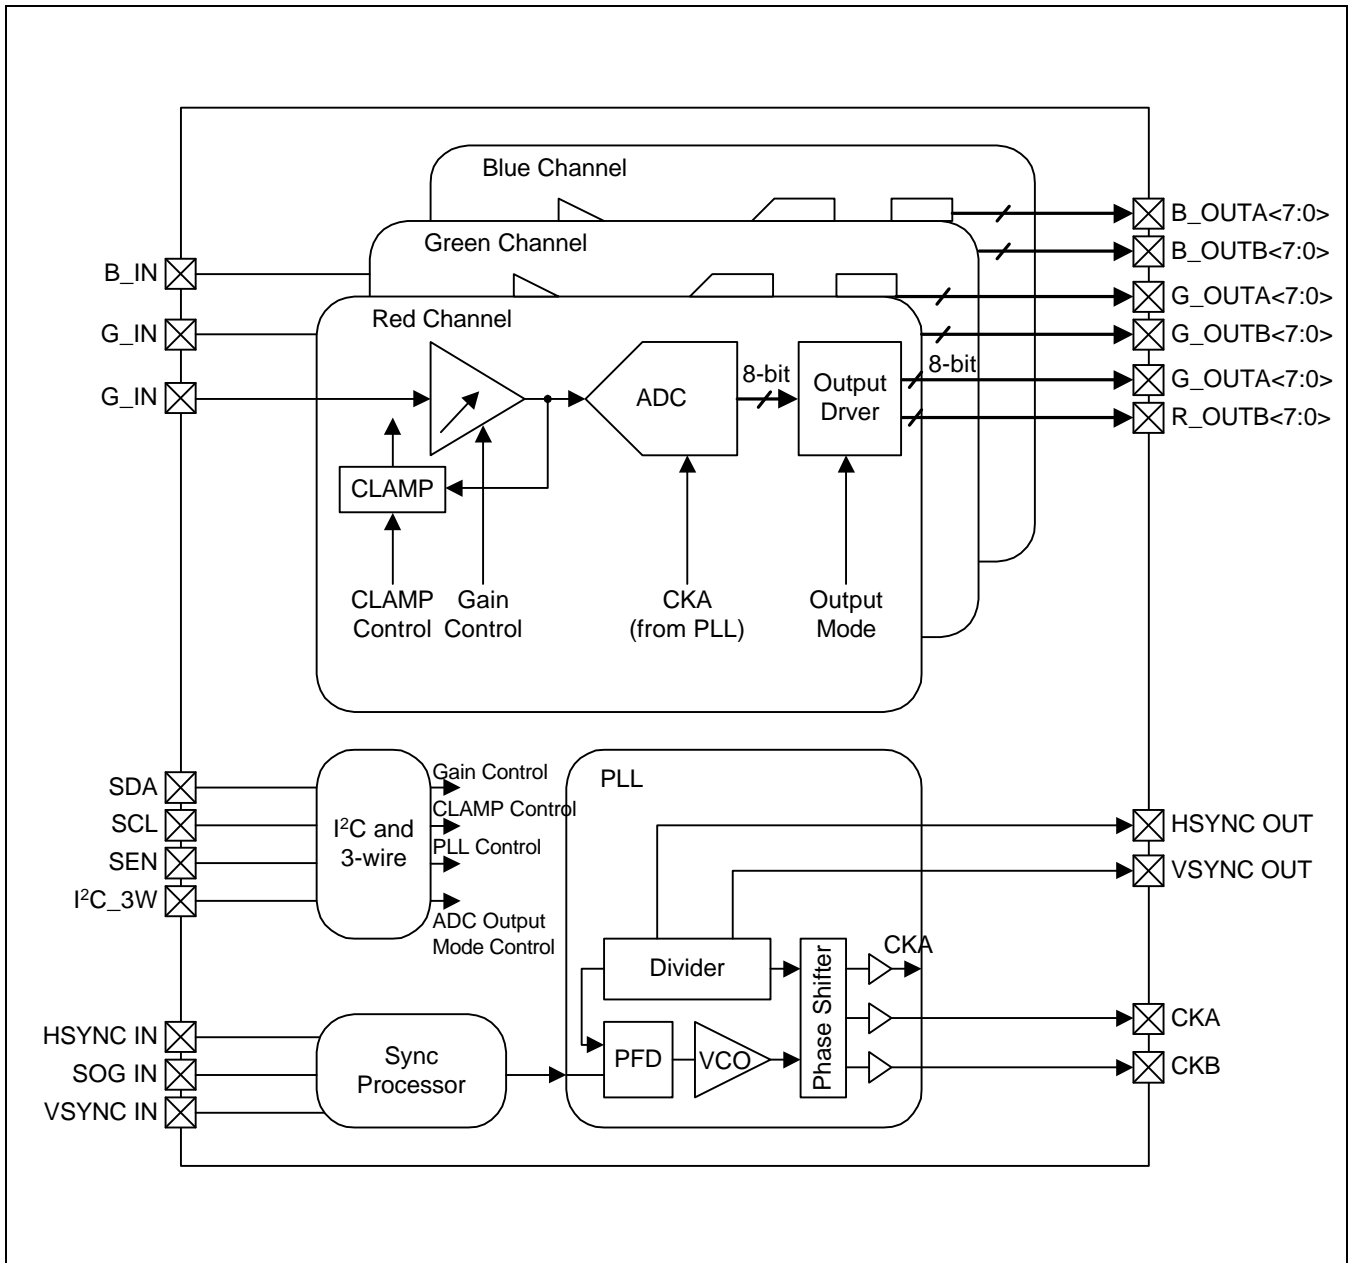

## APPLICATIONS

- RGB high speed digitizing
- LCD desktop monitor
- Plasma display pannel panel

PIN ASSIGNMENT

## PIN DESCRIPTION

Table 1. Pin Description

No	Name	Description
1	VSSC_AR	Red channel ADC 0V analog power supply
2	VDDC_AR	Red channel ADC 5V analog power supply
3	R_IN	Red channel analog input signal
4	VDDC_PR	Red channel pre-amp 5V power supply
5	R_VOUT1	Red channel pre-amp output signal
6	VSSC_PR	Red channel pre-amp 0V power supply
7	R_CLPC	Red channel clamp control external cap.
8	VDDA_AG	Green channel ADC 3.3V analog power supply
9	VSSA_AG	Green channel ADC 0V analog power supply
10	VSSC_AG	Green channel ADC 0V analog power supply
11	VDDC_AG	Green channel ADC 5V analog power supply
12	G_IN	Green channel analog input signal
13	VDDC_PG	Green channel pre-amp 5V power supply
14	G_VOUT1	Green channel pre-amp output signal
15	VSSC_PG	Green channel pre-amp 0V power supply
16	G_CLPC	Green channel clamp control external cap.
17	VDDA_AB	Blue channel ADC 3.3V analog power supply
18	VSSA_AB	Blue channel ADC 0V analog power supply
19	VSSC_AB	Blue channel ADC 0V analog power supply
20	VDDC_AB	Blue channel ADC 5V analog power supply
21	B_IN	Blue channel analog input signal
22	VDDC_PB	Blue channel pre-amp 5V power supply
23	B_VOUT1	Blue channel pre-amp output signal
24	VSSC_PB	Blue channel pre-amp 0V power supply
25	B_CLPC	Blue channel clamp control external cap.
26	VDDC_SP	SyncProc 5V power supply
27	VSSC_SP	SyncProc 0V power supply
28	CLPex	External clamp signal input pin
29	DETCAP	SOG polarity output
30	SOG_IN	SOG signal input pin
31	HSYNC_IN	HSYNC signal input pin
32	Test

144	VSSA_AR	Red channel ADC 0V analog power supply

## DESCRIPTION OF EACH BLOCK

AD2516X is equipped with a pre-amp that can control the gain and clamp level and can generate the pixel clock synchronized to input HSYNC through the internal PLL. It then converts the RGB signal from analog -to- digital by synchronizing to the generated clock. It has a maximum conversion speed of 180MHz and is capable of supporting up to UXGA (1600 × 1200).

Figure 1. Pre-amp Block Diagram

Figure 1 is a block diagram of the pre-amp that is used in AD2516X. A clamp circuit is required to set the input DC level because the RGB signal input is AC coupled as it passes through the capacitor to be sent to the pre-amp. The signal to control the clamp is made from the HSYNC signal in the sync processor block. The clamp level control, which uses an 8-bit DAC, has two modes, first, the coarse level control that controls 3 RGB channels simultaneously and, second, the fine level control that controls each channel clamp level independently. The input signal is gain controlled through the 8-bit DAC for a maximum gain amplification of 2.3dB. As in the clamp level control, the pre-amp has two modes: 1.) coarse level control that controls 3 RGB channels simultaneously and 2.) fine level control which controls them independently.

Figure 2. ADC Block Diagram

Figure 2 which has the 2-step pipeline configuration is a block diagram of the ADC used in AD2516X. It uses 1 overlap bit for digital correction and supports 3 output modes, signal channel mode, dual channel interleaving mode, and dual channel parallel mode.

The sync processor block converts the HSYNC or SOG input to a positive HSYNC signal, which can be processed by PLL, and also makes the clock signal needed for clamp level control from the HSYNC. When HSYNC and SOG inputs enter simultaneously, it is designed to place priority on the HSYNC.

Figure 3. PLL Block Diagram

Figure 3 is a block diagram of the PLL used in AD2516X. It generates the pixel clock by using the positive HSYNC signal from the sync processor block and the divider coefficient determined by the resolution. The reference clock frequency range is between 20kHz - 150kHz and the maximum output clock frequency is 180MHz. It produces two clock signals having the ADC clock frequency and each signal can have 7.5° phase control.

AD2516X is controlled entirely through serial interface, which supports two modes -12C bus and 3-wire interface.

**Wired Interface Timing Diagram**

**Figure 4. Wired Interface Write Mode Timing Diagram**

**Figure 5. Wired Interface Read Mode Timing Diagram**

### Serial Interface Description

#### Pre-amp Gain Control

- Coarse gain control (S00)  
RGB coarse gain control with same value. (dynamic gain range: 40dB)
- Fine gain control (S01 - S03)  
RGB fine gain control independently. (dynamic gain range : 11 dB)
- Coarse brightness control (S04)  
RGB coarse brightness control with same value. (clamp range: 0 - 4V)
- Fine brightness control (S05 - S07)  
RGB fine bright control independently. (clamp range: -0.5V - 0.5V)

#### Sync Processor Control

- HSYNC selection control (HSEL)  
HSEL = 0: Internally polarity converted HSYNC is used  
HSEL = 1: Default HSYNC is used
- HSYNC input polarity control (PHSYNC)  
It is available if HSEL = 1  
PHSYNC = 0: Default HSYNC input is used  
PHSYNC = 1: Inverted HSYNC input is used
- Clamp control clock selection (CLPENB)  
CLPENB = 0: Internal clamp signal  
CLPENB = 1: External clamp signal (by CLPex)

- Clamp pulse width control (CW)

CW<1:0>	Pulse Width
00	0.31us
01	0.54us
10	0.78us
11	1.01us

- DACTEST output selection control (DACTEST)  
Select one of eight DAC output current

DACTEST<7:0>	Selected DAC
11111111	No selection
11111110	Coarse gain control DAC
11111101	Red channel fine gain control DAC
11111011	Green channel fine gain control DAC
11110111	Blue channel fine gain control DAC
11101111	Coarse brightness control DAC
11011111	Red channel fine brightness control DAC select
10111111	Green channel fine brightness control DAC select
01111111	Blue channel fine brightness control DAC select

#### Analog-to-Digital Converter (ADC) Control

- Output mode selection (M)

M<1:0>	Output mode
00	Single channel output mode
01	Dual channel interleaving output mode
10	Dual channel parallel output mode

Output mode	ADC_CK 
Single channel output mode	Channel A  Channel B 
Dual channel interleaving output mode	Channel A  Channel B 
Dual channel parallel output mode	Channel A  Channel B 

- ADC clock output control (ADCK\_ENB)  
ADCK\_ENB = 0: Output clock is enabled  
ADCK\_ENB = 1: Output clock is disabled (HZ)
- ADC clock output inverting control (ADCK\_INV)  
ADCK\_INV = 0: Default ADC\_CK and ADC\_CKB output  
ADCK\_INV = 1: Inverted ADC\_CK and ADC\_CKB output
- ADC clock selection control (ADCK\_SEL)  
ADCK\_SEL = 0: Internal PLL output is used  
ADCK\_SEL = 1: External clock (ADC\_CKEX) is used
- ADC output buffer state control (ADOM)

ADOM<1:0>	Output Buffer State
00	Normal output mode
01	01010101
10	10101010

#### Phase-Locked loop (PLL) Control

- VCO free running frequency control (IFRSH)

IFRSH<1:0>	Free Running Frequency
00	Default VCO max. freq.
01	Increase VCO max. freq. 7.5%
10	Increase VCO max. freq. 15%
11	Increase VCO max. freq. 30%

- VCO frequency range control (IFRSEL)

IFRSEL<2:0>	Frequency Range (MHz)	IFRSEL<2:0>	Frequency Range (MHz)
000	17 - 53	100	103 - 143
001	34 - 78	101	136 - 165
010	65 - 103	110	162 - 187
011	94 - 118	111	181 - 197

- Charge pump current control (ICPSEL)

ICPSEL<2:0>	Current (uA)	ICPSEL<2:0>	Current (uA)
000	50	100	500
001	100	101	750
010	150	110	1400
011	350	111	

- VSYNCO polarity control (VSINV)  
VSINV = 0: Non-inverted VSYNC output  
VSINV = 1: Inverted VSYNC output
- DENO polarity control (DEINV)  
DEINV = 0: Non-inverted DENO output  
DEINV = 1: Inverted DENO output
- HSYNCO polarity control (HSYNMOD)

HSYNMOD<1:0>	Output Polarity
00	Positive HSYNCO
01	Negative HSYNCO
10	Same polarity with input HSYNC
11	Inverted polarity with input HSYNC

- COAST input polarity control (PCOAST)  
PCOAST = 0: Default COAST signal is used  
PCOAST = 1: Inverted COAST signal is used
- PLL output clock phase control (AC, BC, CC)  
AC<5:0>: ADC clock phase control  
BC<5:0>: CKB output clock phase control  
CC<5:0>: CKC output clock phase control  
0 to 47 is available 7.5° phase control by LSB

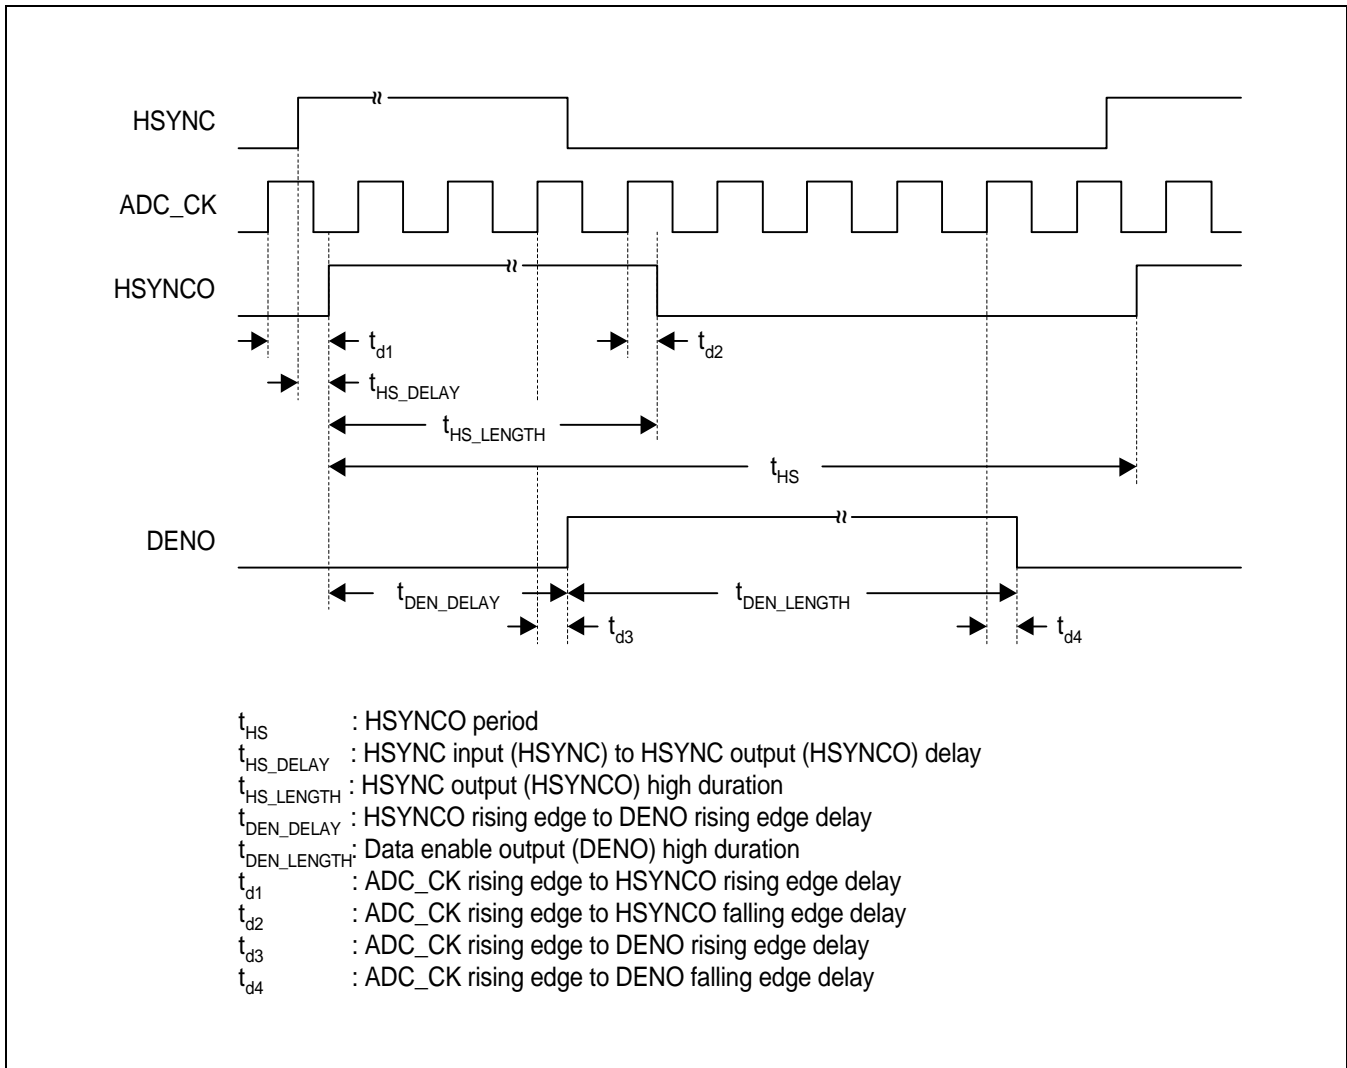

Figure 6. HSYNCO and DENO Output Timing Diagram

- Divider register (DIV)  
This register controls the PLL frequency. Default value is 1664 (680H)  
 $t_{HS} = T \times DIV$  ( $T$ : VCO clock period,  $512 \leq DIV \leq 4096$ )
- HSYNCO duty control (HSD)  
 $t_{HS\_LENGTH} = HSD \times T - t_{d1} + t_{d2}$ ,  $HSD \geq 5$
- DENO signal delay control (DED)  
 $t_{DEN\_DELAY} = DED \times T - t_{d1} + t_{d3}$ ,  $DED \geq 5$
- DENO duty control (DEL)  
 $t_{DEN\_LENGTH} = (DIV - DED - DEL) \times T - t_{d3} + t_{d4}$ ,  $DEL \geq 5$

**Fig7. VSYNCO Output Timing Diagram**

- VSYNCO signal delay control (VSD)  
 $t_{VS\_DELAY} = VSD \times DIV \times T - t_{d5}, VSD \geq 0$
- VSYNCO signal length control (VSL)  
 $t_{VS\_LENGTH} = VSL \times DIV \times T - t_{d5} + t_{d6}, VSL \geq 1$
- PLL output clock enable (CKA\_ENB, CKB\_ENB, CKC\_ENB)  
 0: Output is enabled  
 1: Output is disabled (low output)
- PLL output clock inverting control (CKA\_INV, CKB\_INV, CKC\_INV)  
 0: Non-inverted clock output  
 1: Inverted clock output
- PLL VI converter gain control (VI\_GAIN)  
 0: 375 uA/V  
 1: 470 uA/V

## TIMING DIAGRAM

Figure 9. ADC Clock Timing Diagram

Figure 10. ADC Timing Diagram

APPLICATION CIRCUIT

All supply pins have to be decoupled, with two capacitors: one for high frequencies (approximately 1nF) and one for the low frequencies (approximately 100nF or higher).

PLL loop filter (C1, C2, R1)

$$f_n = \frac{1}{2p} \sqrt{\frac{K_o I_p}{(C_1 + C_2)N}}$$

where :

$f_n$  = the natural PLL frequency

$K_o$  = the VCO gain

$N$  = the division number

$C_1$  and  $C_2$  = capacitors of the PLL filter

$$f_z = \frac{1}{2p \times R_1 \times C_1} \quad \text{and} \quad \mathbf{x} = \frac{1}{2} \times \frac{f_n}{f_z}$$

where :

$f_z$  = loop filter zero frequency

$R_1$  = the chosen resistance for the filter

$\mathbf{x}$  = the damping factor

$C_1$ ,  $C_2$ , and  $R_1$  values are selected to satisfy the following conditions.

$$f_n / f_{ref} \cong 0.05$$

$$\mathbf{x} \cong 1.5$$
