DESCRIPTION

The FCT16373 family of products are 16-bit buffered latches with three-state outputs that are ideal for driving address and data buses. The output enable and latch enable controls are organized to operate each device as two 8-bit latches, or one 16-bit latch. Easy board layout is facilitated by the use of flow-through pinouts and byte enable controls provide architectural flexibility for systems designers. All outputs have ground bounce suppression circuitry (see QSI Application Note AN-01) and many power and ground pins provide low ground bounce. To accommodate hot-plug or live insertion applications, both versions of this product were designed not to load an active bus when V_{CC} is removed. In applications where bus signals are point-to-point or driving light capacitance loads, the balanced drive FCT162373 is recommended.
