GENERAL DESCRIPTION

The TC4803/4 are BiCMOS optocoupled driver ICs for switching loads when electrical isolation is desired. Input drive current is converted to low impedance voltage drive with the ability to drive 1.4A peak current into a capacitive load of 1,000 pF with fast output rise and fall times. UV lockout circuitry forces the output to a "off" state when the input voltage drops below 7.8V. 0.4V of hysteresis prevents output toggling around the drop-out voltage. The output "off" state is high on TC4803 and low on TC4804.

For switching many loads in low-power regimes, these drivers, because they reduce shoot-through currents in the output stage, require significantly less power at higher frequencies, and can be helpful in meeting low-power budgets.

These devices are built using Teledyne Components' new Tough CMOS process and are capable of giving reliable service in the most demanding electrical environments.

They will not latch under normal conditions within their power and voltage ratings. All terminals are fully protected against up to 4 kV of electrostatic discharge.
