

# 8K/16K x 18 Deep Sync FIFOs

#### Features

- High-speed, low-power, first-in first-out (FIFO) memories
- 8K x 18 (CY7C4255)
- 16K x 18 (CY7C4265)
- 0.5 micron CMOS for optimum speed/power
- High-speed 100-MHz operation (10-ns read/write cycle times)
- Low power I<sub>CC</sub> = 45 mA
- · Fully asynchronous and simultaneous read and write operation
- · Empty, Full, Half Full, and programmable Almost Empty and Almost Full status flags
- TTL compatible
- · Retransmit function
- Output Enable (OE) pins
- · Independent read and write enable pins
- Center power and ground pins for reduced noise
- Supports free-running 50% duty cycle clock inputs
- · Width Expansion Capability
- Depth Expansion Capability
- 64-pin TQFP and 64-pin STQFP
- Pin-compatible density upgrade to CY7C42X5 family
- · Pin-compatible density upgrade to IDT72205/15/25/35/45

## **Functional Description**

The CY7C4255/65 are high-speed, low-power, first-in first-out (FIFO) memories with clocked read and write interfaces. All

are 18 bits wide and are pin/functionally compatible to the CY7C42X5 Synchronous FIFO family. The CY7C4255/65 can be cascaded to increase FIFO depth. Programmable features include Almost Full/Almost Empty flags. These FIFOs provide solutions for a wide variety of data buffering needs, including high-speed data acquisition, multiprocessor interfaces, and communications buffering.

These FIFOs have 18-bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a Free-Running Clock (WCLK) and a Write Enable pin (WEN).

When WEN is asserted, data is written into the FIFO on the rising edge of the WCLK signal. While WEN is held active, data is continually written into the FIFO on each cycle. The output port is controlled in a similar manner by a free-running Read Clock (RCLK) and a Read Enable pin (REN). In addition, the CY7C4255/65 have an Output Enable pin (OE). The read and write clocks may be tied together for single-clock operation or the two clocks may be run independently for asynchronous read/write applications. Clock frequencies up to 100 MHz are achievable.

Retransmit and Synchronous Almost Full/Almost Empty flag features are available on these devices.

Depth expansion is possible using the Cascade Input (WXI, RXI), Cascade Output (WXO, RXO), and First Load (FL) pins. The WXO and RXO pins are connected to the WXI and RXI pins of the next device, and the WXO and RXO pins of the last device should be connected to the WXI and RXI pins of the first device. The FL pin of the first device is tied to V<sub>SS</sub> and the FL pin of all the remaining devices should be tied to  $V_{CC}$ .

## **Pin Configurations**

# Functional Description (continued)

The CY7C4255/65 provides five status pins. These pins are decoded to determine one of five states: Empty, Almost Empty, Half Full, Almost Full, and Full. The Half Full flag shares the WXO pin. This flag is valid in the stand-alone and width-expansion configurations. In the depth expansion, this pin provides the expansion out  $(\overline{WXO})$  information that is used to signal the next FIFO when it will be activated.

The Empty and Full flags are synchronous, i.e., they change state relative to either the Read Clock (RCLK) or the Write Clock (WCLK). When entering or exiting the Empty states, the flag is updated exclusively by the RCLK. The flag denoting Full states is updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags will remain valid from one clock cycle to the next. The Almost Empty/Almost Full flags become synchronous if the  $V_{CC}/SMODE$  is tied to  $V_{SS}$ . All configurations are fabricated using an advanced  $0.5\mu$  CMOS technology. Input ESD protection is greater than 2001V, and latch-up is prevented by the use of guard rings.

## **Selection Guide**

		7C4255/65-10	7C4255/65-15	7C4255/65-25	7C4255/65-35
Maximum Frequency (MI	Hz)	100	66.7	40	28.6
Maximum Access Time (I	ns)	8	10	15	20
Minimum Cycle Time (ns)		10	15	25	35
Minimum Data or Enable	Set-Up (ns)	3	4	6	7
Minimum Data or Enable	Hold (ns)	0.5	1	1	2
Maximum Flag Delay (ns	)	8	10	15	20
Active Power Supply Current (I <sub>CC1</sub> ) (mA)	Commercial	45	45	45	45
	Industrial	50	50	50	50

	CY7C4255	CY7C4265
Density	8K x 18	16K x18
Package	64-pin TQFP, STQFP	64-pin TQFP, STQFP

Signal Name	Description	I/O	Function
D <sub>0 -17</sub>	Data Inputs	I	Data inputs for an 18-bit bus.
Q <sub>0-17</sub>	Data Outputs	0	Data outputs for an 18-bit bus.
WEN	Write Enable	ı	Enables the WCLK inpu.t
REN	Read Enable	I	Enables the RCLK input.
WCLK	Write Clock	I	The rising edge clocks data into the FIFO when WEN is LOW and the FIFO is not Full. When LD is asserted, WCLK writes data into the programmable flag-offset register.
RCLK	Read Clock	I	The rising edge clocks data out of the FIFO when REN is LOW and the FIFO is not Empty. When LD is asserted, RCLK reads data out of the programmable flag-off-set register.
WXO/HF	Write Expansion Out/Half Full Flag	0	Dual-Mode Pin: Single device or width expansion – Half Full status flag. Cascaded – Write Expansion Out signal, connected to WXI of next device.
EF	Empty Flag	0	When EF is LOW, the FIFO is empty. EF is synchronized to RCLK.
FF	Full Flag	0	When FF is LOW, the FIFO is full. FF is synchronized to WCLK.
PAE	Programmable Almost Empty	0	When PAE is LOW, the FIFO is almost empty based on the almost-empty offset value programmed into the FIFO. PAE is asynchronous when $V_{CC}/SMODE$ is tied to $V_{CC}$ ; it is synchronized to RCLK when $V_{CC}/SMODE$ is tied to $V_{SS}$ .
PAF	Programmable Almost Full	0	When $\overline{\text{PAF}}$ is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO. PAF is asynchronous when $V_{CC}/SMODE$ is tied to $V_{CC}$ ; it is synchronized to WCLK when $V_{CC}/SMODE$ is tied to $V_{SS}$ .
LD	Load	I	When $\overline{\text{LD}}$ is LOW, $\text{D}_{0-17}$ ( $\text{Q}_{0-17}$ ) are written (read) into (from) the programmable-flag-offset register.
FL/RT	First Load/ Retransmit	I	Dual-Mode Pin: Cascaded – The first device in the daisy chain will have $\overline{FL}$ tied to $V_{SS}$ ; all other devices will have $\overline{FL}$ tied to $V_{CC}$ . In standard mode or width expansion, $\overline{FL}$ is tied to $V_{SS}$ on all devices. Not Cascaded – Tied to $V_{SS}$ . Retransmit function is also available in stand-alone mode by strobing RT.
WXI	Write Expansion Input	I	Cascaded – Connected to WXO of previous device.  Not Cascaded – Tied to V <sub>SS</sub> .
RXI	Read Expansion Input	I	Cascaded – Connected to RXO of previous device.  Not Cascaded – Tied to V <sub>SS</sub> .
RXO	Read Expansion Output	0	Cascaded – Connected to RXI of next device.
RS	Reset	I	Resets device to empty condition. A reset is required before an initial read or write operation after power-up.
OE	Output Enable	-	When OE is LOW, the FIFO's data outputs drive the bus to which they are connected. If OE is HIGH, the FIFO's outputs are in High Z (high-impedance) state.
V <sub>CC</sub> /SMODE	Synchronous Almost Empty/ Almost Full Flags	I	Dual-Mode Pin: Asynchronous Almost Empty/Almost Full flags – tied to V <sub>CC</sub> . Synchronous Almost Empty/Almost Full flags – tied to V <sub>SS</sub> . (Almost Empty synchronized to RCLK, Almost Full synchronized to WCLK.)

# **Switching Waveforms**

### **Write Cycle Timing**

#### **Read Cycle Timing**

t<sub>SKEW1</sub> is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that FF will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t<sub>SKEW1</sub>, then FF may not change state until the next WCLK rising edge. t<sub>SKEW2</sub> is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that EF will go HIGH during the current clock cycle. It the time between the rising edge of WCLK and the rising edge of RCLK is less than t<sub>SKEW2</sub>, then EF may not change state until the next RCLK rising edge. 15.

# Reset Timing [17]

#### First Data Word Latency after Reset with Simultaneous Read and Write

- The clocks (RCLK, WCLK) can be free-running during reset.
   After reset, the outputs will be LOW if OE = 0 and three-state if OE = 1.
   When t<sub>SKEW2</sub> ≥ minimum specification, t<sub>FRL</sub> (maximum) = t<sub>CLK</sub> + t<sub>SKEW2</sub>. When t<sub>SKEW2</sub> < minimum specification, t<sub>FRL</sub> (maximum) = either 2\*t<sub>CLK</sub> + t<sub>SKEW2</sub> or t<sub>CLK</sub> + t<sub>SKEW2</sub>. The Latency Timing applies only at the Empty Boundary (EF = LOW).
   The first word is available the cycle after EF goes HIGH, always.

# **Full FlagTiming**

## Half-Full Flag Timing

## **Programmable Almost Empty Flag Timing**

#### Note:

21.  $\overline{PAE}$  is offset = n. Number of data words into FIFO already = n.

# Programmable Almost Empty Flag Timing (applies only in SMODE (SMODE is LOW))

#### **Programmable Almost Full Flag Timing**

- 22. PAE offset n.
   23. t<sub>SKEW3</sub> is the minimum time between a rising WCLK and a rising RCLK edge for PAE to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than t<sub>SKEW3</sub>, then PAE may not change state until the next RCLK.
   24. If a read is preformed on this rising edge of the read clock, there will be Empty + (n-1) words in the FIFO when PAE goes LOW.
   25. PAF offset = m. Number of data words written into FIFO already = 8192 (m + 1) for the CY7C4255 and 16384 (m + 1) for the CY7C4265.

- PAF is offset = m.
- R192 m words in CY7C4255 and 16384 m words in CY7C4265. 8192 (m + 1) words in CY7C4255 and 16384 (m + 1) CY7C4265.

# Programmable Almost Full Flag Timing (applies only in SMODE (SMODE is LOW))

#### Write Programmable Registers

- 29. If a write is performed on this rising edge of the write clock, there will be Full (m–1) words of the FIFO when PAF goes LOW.
   30. PAF offset = m.
   31. t<sub>SKEW3</sub> is the minimum time between a rising RCLK and a rising WCLK edge for PAF to change state during that clock cycle. If the time between the edge of RCLK and the rising edge of WCLK is less than t<sub>SKEW3</sub>, then PAF may not change state until the next WCLK rising edge.

## **Read Programmable Registers**

# Write Expansion Out Timing

# **Read Expansion Out Timing**

# Write Expansion In Timing

- 32. Write to Last Physical Location.33. Read from Last Physical Location.

## **Read Expansion In Timing**

- 34. Clocks are free-running in this case.
  35. The flags may change state during Retransmit as a result of the offset of the read and write pointers, but flags will be valid at t<sub>RTR</sub>.
  36. For the synchronous PAE and PAF flags (SMODE), an appropriate clock cycle is necessary after t<sub>RTR</sub> to update these flags.

#### **Architecture**

The CY7C4256/65 consists of an array of 8K/16K words of 18 bits each (implemented by a dual-port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN, WEN, RS), and flags (EF, PAE, HF, PAF, FF). The CY7C4255/65 also includes the control signals WXI, RXI, WXO, RXO for depth expansion.

## Resetting the FIFO

Upon power-up, the FIFO must be reset with a Reset (RS) cycle. This causes the FIFO to enter the Empty condition signified by EF being LOW. All data outputs go LOW after the falling edge of RS only if OE is asserted. In order for the FIFO to reset to its default state, a falling edge must occur on RS and the user must not read or write while RS is LOW.

## **FIFO Operation**

When the  $\overline{\text{WEN}}$  signal is active (LOW), data present on the D<sub>0-17</sub> pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the REN signal is active LOW, data in the FIFO memory will be presented on the Q<sub>0-17</sub> outputs. New data will be presented on each rising edge of RCLK while REN is active LOW and OE is LOW. REN must set up  $t_{ENS}$  before RCLK for it to be a valid read function. WEN must occur tENS before WCLK for it to be a valid write function.

An output enable  $(\overline{OE})$  pin is provided to three-state the  $Q_{0-17}$  outputs when  $\overline{OE}$  is deasserted. When  $\overline{OE}$  is enabled (LOW), data in the output register will be available to the  $Q_{0-17}$  outputs after  $t_{OE}$ . If devices are cascaded, the  $\overline{OE}$  function will only output data on the FIFO that is read enabled.

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and under flow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its  $Q_{0-17}$  outputs even after additional reads occur.

#### **Programming**

The CY7C4255/65 devices contain two 14-bit offset registers. Data present on  $D_{0-13}$  during a program write will determine the distance from Empty (Full) that the Almost Empty (Almost Full) flags become active. If the user elects not to program the FIFO's flags, the default offset values are used (see Table 2). When the Load LD pin is set LOW and WEN is set LOW, data on the inputs  $D_{0-13}$  is written into the Empty offset register on the first LOW-to-HIGH transition of the Write Clock (WCLK). When the LD pin and WEN are held LOW then data is written into the Full offset register on the second LOW-to-HIGH transition of the Write Clock (WCLK). The third transition of the Write Clock (WCLK) again writes to the Empty offset register (see Table 1). Writing all offset registers does not have to occur at one time. One or two offset registers can be written and then, by bringing the LD pin HIGH, the FIFO is returned to normal read/write

operation. When the  $\overline{\text{LD}}$  pin is set LOW, and  $\overline{\text{WEN}}$  is LOW, the next offset register in sequence is written.

The contents of the offset registers can be read on the output lines when the LD pin is set LOW and REN is set LOW; then, data can be read on the LOW-to-HIGH transition of the Read Clock (RCLK).

Table 1. Write Offset Register

LD	WEN	WCLK <sup>[37]</sup>	Selection
0	0	<b> </b>	Writing to offset registers: Empty Offset Full Offset
0	1		No Operation
1	0		Write Into FIFO
1	1		No Operation

## Flag Operation

The CY7C4255/65 devices provide five flag pins to indicate the condition of the FIFO contents. Empty and Full are synchronous. PAE and PAF are synchronous if  $V_{CC}/SMODE$  is tied to  $V_{SS}$ .

#### **Full Flag**

The Full Flag (FF) will go LOW when device is Full. Write oper<u>ations</u> are inhibited whenever FF is LOW regardless of the state of WEN. FF is synchronized to WCLK, i.e., it is exclusively updated by each rising edge of WCLK.

#### **Empty Flag**

The Empty Flag (EF) will go LOW when the device is empty. Read operations are inhibited whenever EF is LOW, regardless of the state of REN. EF is synchronized to RCLK, i.e., it is exclusively updated by each rising edge of RCLK.

#### Programmable Almost Empty/Almost Full Flag

The CY7C4255/65 features programmable Almost Empty and Almost Full Flags. Each flag can be programmed (described in the Programming section) a specific distance from the corresponding boundary flags (Empty or Full). When the FIFO contains the number of words or fewer for which the flags have been programmed, the PAF or PAE will be asserted, signifying that the FIFO is either Almost Full or Almost Empty. See *Table 2* for a description of programmable flags.

When the SMODE pin is tied LOW, the PAF flag signal transition is caused by the rising edge of the write clock and the PAE flag transition is caused by the rising edge of the read clock.

#### Notes:

37. The same selection sequence applies to reading from the registers. REN is enabled and read is performed on the LOW-to-HIGH transition of RCLK.

#### Retransmit

The retransmit feature is beneficial when transferring packets of data. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary.

The Retransmit (RT) input is active in the stand-alone and width expansion modes. The retransmit feature is intended for use when a number of writes equal to or less than the depth of the FIFO have occurred and at least one word has been read since the last RS cycle. A HIGH pulse on RT resets the internal read pointer to the first physical location of the FIFO. WCLK and RCLK may be free running but must be disabled during and t<sub>RTR</sub> after the retransmit pulse. With every valid read cycle after retransmit, previously accessed data is read and the read pointer is incremented until it is equal to the write pointer. Flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Data written to the FIFO after activation of RT are transmitted also.

The full depth of the FIFO can be repeatedly retransmitted.

Table 2. Flag Truth Table

Number of						
CY7C4255 – 8K x 18			PAF	HF	PAE	EF
0	0	Н	Н	Н	L	L
1 to n <sup>[38]</sup>	1 to n <sup>[38]</sup>	Н	Н	Н	L	Н

4097 to (8192–(m+1))	8193 to (16384 –(m+1))	Н	Н	L	Н	Н
(8192-m) <sup>[39]</sup> to 8191	(16384-m) <sup>[39]</sup> to 16383	Н	L	L	Н	Н
8192	16384	L	L	L	Н	Н

#### Notes:

38. n = Empty Offset (Default Values: CY7C4255/CY7C4265 n = 127). 39. m = Full Offset (Default Values: CY7C4255/CY7C4265 n = 127).

# Width Expansion Configuration

The CY7C4255/65 can be expanded in width to provide word widths greater than 18 in increments of 18. During width expansion mode all control line inputs are common and all flags are available. Empty (Full) flags should be created by ANDing

the Empty (Full) flags of every FIFO; the PAE and PAF flags can be detected from any one device. This technique will avoid reading data from, or writing data to the FIFO that is "staggered" by one clock cycle due to the variations in skew between RCLK and WCLK. *Figure 1* demonstrates a 36-word width by using two CY7C4255/65s.

# Depth Expansion Configuration (with Programmable Flags)

The CY7C4255/65 can easily be adapted to applications requiring more than 8192/16384 words of buffering. *Figure 2* shows Depth Expansion using three CY7C42X5s. Maximum depth is limited only by signal loading. Follow these steps:

- The first device must be designated by grounding the First Load (FL) control input.
- 2. All other devices must have  $\overline{FL}$  in the HIGH state.

- 3. The Write Expansion Out (\overline{\text{WXO}}) pin of each device must be tied to the Write Expansion In (\overline{\text{WXI}}) pin of the next device.
- 4. The Read Expansion Out (RXO) pin of each device must be tied to the Read Expansion In (RXI) pin of the next device.
- 5. All Load (LD) pins are tied together.
- The Half-Full Flag (HF) is not available in the Depth Expansion Configuration.
- 7. EF, FF, PAE, and PAF are created with composite flags by ORing together these respective flags for monitoring. The composite PAE and PAF flags are not precise.
