

TOSHIBA Intelligent Power Device High Voltage Monolithic Silicon Power IC

TPD4105AK

The TPD4105AK is a DC brush less motor driver using high voltage PWM control. It is fabricated by high voltage SOI process. It contains level shift high-side driver, low-side driver, IGBT outputs, FRDs and protective functions for under voltage protection circuits and thermal shutdown circuit. It is easy to control a DC brush less motor by just putting logic inputs from a MPU or motor controller to the TPD4105AK.

Features

- Bootstrap circuit gives simple high side power supply.
- Bootstrap diodes are built in.
- A dead time can be set as a minimum of 1.4 μ s, and it is the best for a Sine-wave from drive.
- 3-phase bridge output using IGBTs.
- FRDs are built in.
- Included under voltage protection and thermal shutdown.
- The regulator of 7V (typ.) is built in.
- Package: 23-pin HZIP.

This product has a MOS structure and is sensitive to electrostatic discharge. When handling this product, ensure that the environment is protected against electrostatic discharge.

Block Diagram

Pin Description

Pin No.	Symbol	Pin Description
1	HU	The control terminal of IGBT by the side of U top arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
2	HV	The control terminal of IGBT by the side of V top arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
3	HW	The control terminal of IGBT by the side of W top arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
4	LU	The control terminal of IGBT by the side of U bottom arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
5	LV	The control terminal of IGBT by the side of V bottom arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
6	LW	The control terminal of IGBT by the side of W bottom arm. It turns off more than by 1.5V. It turns on more than by 3.5V.
7	IS1	IGBT emitter and FRD anode pin.
8	NC	Unused pin, which is not connected to the chip internally.
9	BSU	U-phase bootstrap capacitor connecting pin.
10	U	U-phase output pin.
11	V _{BB1}	U and V-phase high-voltage power supply input pin.
12	BSV	V-phase bootstrap capacitor connecting pin.
13	V	V-phase output pin.
14	BSW	W-phase bootstrap capacitor connecting pin.
15	W	W-phase output pin.
16	V _{BB2}	W-phase high-voltage power supply input pin.
17	NC	Unused pin, which is not connected to the chip internally.
18	IS2	IGBT emitter and FRD anode pin.
19	NC	Unused pin, which is not connected to the chip internally.
20	DIAG	With the diagnostic output terminal of open drain , a pull-up is carried out by resistance. It turns it on at the time of unusual.
21	V _{CC}	Control power supply pin.(15V typ.)
22	GND	Ground pin.
23	V _{REG}	7V regulator output pin.

Notes: Release of Thermal shutdown protection and under voltage protection depends release of a self-reset .

Absolute Maximum Ratings (Ta = 25°C)

Characteristics	Symbol	Rating	Unit
Power supply voltage	V _{BB}	500	V
	V _{CC}	18	V
Output current (DC)	I _{out}	3	A
Output current (pulse)	I _{out}	4	A
Input voltage	V _{IN}	-0.5~7	V
V _{REG} current	I _{REG}	50	mA
V _{DIAG} current	I _{DIAG}	20	mA
Power dissipation (Ta = 25°C)	P _C	4	W
Power dissipation (Tc = 25°C)	P _C	20	W
Operating temperature	T _{jopr}	-20~135	°C
Junction temperature	T _j	150	°C
Storage temperature	T _{stg}	-55~150	°C
Lead-heat sink isolation voltage	V _{hs}	1000 (1 min)	Vrms

Electrical Characteristics (Ta = 25°C)

Characteristics	Symbol	Test Condition	Min	Typ.	Max	Unit
Operating power supply voltage	V _{BB}	—	50	280	450	V
	V _{CC}	—	13.5	15	16.5	
Current dissipation	I _{BB}	V _{BB} = 400 V	—	0	0.5	mA
	I _{CC}	V _{CC} = 15 V	—	1	5	
	I _{BS} (ON)	V _{BS} = 15 V, high side ON	—	300	410	μA
	I _{BS} (OFF)	V _{BS} = 15 V, high side OFF	—	270	370	
Input voltage	V _{IH}	V _{IN} = "H"	3.5	—	—	V
	V _{IL}	V _{IN} = "L"	—	—	1.5	
Input current	I _{IH}	V _{IN} = 5 V	—	—	150	μA
	I _{IL}	V _{IN} = 0 V	—	—	100	
Output saturation voltage	V _{CEsat} H	V _{CC} = 15 V, I _C = 1.5 A	—	2.4	3	V
	V _{CEsat} L	V _{CC} = 15 V, I _C = 1.5 A	—	2.4	3	
FRD forward voltage	V _F H	I _F = 1.5 A, high side	—	1.6	2.0	V
	V _F L	I _F = 1.5 A, low side	—	1.6	2.0	
Regulator voltage	V _{REG}	V _{CC} = 15 V, I _O = 30 mA	6.5	7	7.5	V
BSD forward voltage	V _F (BSD)	I _F = 500 μA	—	0.9	1.2	V
Thermal shutdown temperature	TSD	V _{CC} = 15 V	135	—	185	
Thermal shutdown hysteresis	ΔTSD	V _{CC} = 15 V	—	50	—	
V _{CC} under voltage protection	V _{CC} UVD	—	10	11	12	V
V _{CC} under voltage protection recovery	V _{CC} UVR	—	10.5	11.5	12.5	V
V _{BS} under voltage protection	V _{BS} UVD	—	8	9	9.5	V
V _{BS} under voltage protection recovery	V _{BS} UVR	—	8.5	9.5	10.5	V
DIAG saturation voltage	V _{DIAGsat}	I _{DIAG} = 5 mA	—	—	0.5	V
Output on delay time	t _{on}	V _{BB} = 280 V, I _C = 1.5 A	—	1.5	3	μs
Output off delay time	t _{off}	V _{BB} = 280 V, I _C = 1.5 A	—	1.2	3	μs
Dead time	t _{dead}	V _{BB} = 280 V, I _C = 1.5 A	1.4	—	—	μs
FRD reverse recovery time	t _{rr}	V _{BB} = 280 V, I _C = 1.5 A	—	200	—	ns

Application Circuit Example

External Parts

Standard external parts are shown in the following table.

Part	Recommended Value	Purpose	Remarks
C ₁ , C ₂ , C ₃	25 V/2.2 μ F	Bootstrap capacitor	(Note 1)
R ₁	0.62 $\Omega \pm 1\%$ (1 W)	Current detection	(Note 2)
C ₄	25 V/10 μ F	V _{CC} power supply stability	(Note 3)
C ₅	25 V/0.1 μ F	V _{CC} for surge absorber	(Note 3)
C ₆	16 V/1 μ F	V _{REG} power supply stability	(Note 3)
C ₇	16 V/1000 pF	V _{REG} for surge absorber	(Note 3)
R ₃	5.1 k Ω	DIAG pin pull-up resistor	(Note 4)

Note 1: The required bootstrap capacitance value varies according to the motor drive conditions. The capacitor is biased by V_{CC} and must be sufficiently derated for it.

Note 2: The following formula shows the detection current: $I_O = V_R \div R_{IS}$ (For $V_R = 0.5$ V)
Do not exceed a detection current of 3 A when using this product.
(Please go from the outside in the over current protection.)

Note 3: When using this product, some adjustment is required in accordance with the use environment. When mounting, place as close to the base of this product leads as possible to improve the ripple and noise elimination.

Note 4: The DIAG pin is open drain. Note that when the DIAG pin is connected to a power supply with a voltage higher than or equal to the V_{CC}, a protection circuit is triggered so that the current flows continuously. If not using the DIAG pin, connect to the GND.

Handling precautions

Please control the input signal in the state to which the V_{CC} voltage is steady. Both of the order of the VBB power supply and the V_{CC} power supply are not cared about either.

Note that if the power supply is switched off as described above, this product may be destroyed if the current regeneration route to the VBB power supply is blocked when the VBB line is disconnected by a relay or similar while the motor is still running.

The excess voltage such as the voltage surge which exceed the maximum rating is added, for example, may destroy the circuit. Accordingly, be careful of handling this product or of surge voltage in its application environment.

Description of Protection Function

(1) Under voltage protection

This product incorporates the under voltage protection circuit to prevent the IGBT from operating in unsaturated mode when the V_{CC} voltage or the V_{BS} voltage drops.

When the V_{CC} power supply falls to this product internal setting ($V_{CCUVD} = 11\text{ V typ.}$), all IGBT outputs shut down regardless of the input. This protection function has hysteresis. When the V_{CCUVR} ($= 11.5\text{ V typ.}$) reaches 0.5 V higher than the shutdown voltage, this product is automatically restored and the IGBT is turned on again by the input.

When the V_{BS} supply voltage drops ($V_{BSUVD} = 9\text{ V typ.}$), the high-side IGBT output shuts down. When the V_{BSUVR} ($= 9.5\text{ V typ.}$) reaches 0.5 V higher than the shutdown voltage, the IGBT is turned on again by the input signal.

(2) Thermal shutdown

This product incorporates the thermal shutdown circuit to protect itself against the abnormal state when its temperature rises excessively.

When the temperature of this chip rises due to external causes or internal heat generation and the internal setting T_{SD} reaches 150°C , all IGBT outputs shut down regardless of the input. This protection function has hysteresis ($\Delta T_{SD} = 50^{\circ}\text{C typ.}$). When the chip temperature falls to $T_{SD} - \Delta T_{SD}$, the chip is automatically restored and the IGBT is turned on again by the input.

Because the chip contains just one temperature detection location, when the chip heats up due to the IGBT, for example, the differences in distance from the detection location in the IGBT (the source of the heat) cause differences in the time taken for shutdown to occur. Therefore, the temperature of the chip may rise higher than the thermal shutdown temperature when the circuit started to operate.

Safe Operating Area

Figure 1 SOA at $T_j = 135^{\circ}\text{C}$

Figure 2 SOA at $T_c = 95^{\circ}\text{C}$

Note 1: The above safe operating areas are $T_j = 135^{\circ}\text{C}$ (Figure 1) and $T_c = 95^{\circ}\text{C}$ (Figure 2). If the temperature exceeds these, the safe operation areas reduce.

RESTRICTIONS ON PRODUCT USE

030619EBA

- The information contained herein is subject to change without notice.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- TOSHIBA products should not be embedded to the downstream products which are prohibited to be produced and sold, under any law and regulations.
