## Description

The HD74AC273 has eight edge-triggered D-type flip-flops with individual D inputs and Q outputs. The common

The register is fully edge-triggered. The state of each D input, one setup time before the Low-to-High clock transition, is transferred to the corresponding flip-flops's Q output

All outputs will be forced Low independently of Clock or Data inputs by a Low voltage level on the $\overline{\mathrm{MR}}$ input. The device is useful for applications where the true output only is required and the Clock and Master Reset are common to all storage elements.

## Features
