### Functional Description <sup>[1]</sup>

The CY62157EV18 is a high performance CMOS static RAM organized as 512K words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. The device can also be put into standby mode when

deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW or both  $\overline{BHE}$  and  $\overline{BLE}$  are HIGH). The input and output pins (IO<sub>0</sub> through IO<sub>15</sub>) are placed in a high impedance state when:

- Deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW)
- Outputs are disabled ( $\overline{OE}$  HIGH)
- Both Byte High Enable and Byte Low Enable are disabled ( $\overline{BHE}$ ,  $\overline{BLE}$  HIGH) or
- Write operation is active ( $\overline{CE}_1$  LOW,  $CE_2$  HIGH and  $\overline{WE}$  LOW).

Write to the device by taking Chip Enables ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Write Enable ( $\overline{WE}$ ) input LOW. If Byte Low Enable ( $\overline{BLE}$ ) is LOW, then data from IO pins (IO<sub>0</sub> through IO<sub>7</sub>), is written into the location specified on the address pins (A<sub>0</sub> through A<sub>18</sub>). If Byte High Enable ( $\overline{BHE}$ ) is LOW, then data from IO pins (IO<sub>8</sub> through IO<sub>15</sub>) is written into the location specified on the address pins (A<sub>0</sub> through A<sub>18</sub>).

Read from the device by taking Chip Enables ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Output Enable ( $\overline{OE}$ ) LOW while forcing the Write Enable ( $\overline{WE}$ ) HIGH. If Byte Low Enable ( $\overline{BLE}$ ) is LOW, then data from the memory location specified by the address pins appear on IO<sub>0</sub> to IO<sub>7</sub>. If Byte High Enable ( $\overline{BHE}$ ) is LOW, then data from memory appears on IO<sub>8</sub> to IO<sub>15</sub>. See the “Truth Table” on page 9 for a complete description of read and write modes.

- $V_{IL(min)}$  = -2.0V for pulse durations less than 20 ns.
- $V_{IH(max)}$  =  $V_{CC} + 0.5V$  for pulse durations less than 20 ns.

- Only chip enable ( $\overline{CE}$ ) and byte enables ( $\overline{BHE}$  and  $\overline{BLE}$ ) need to be tied to CMOS levels to meet the  $I_{SB2}$  spec. Other inputs can be left floating.
- Tested initially and after any design or process changes that may affect these parameters.

**Notes**

- Test conditions for all parameters other than tri-state parameters assume signal transition time of 1V/ns or less, timing reference levels of  $V_{CC(typ)}/2$ , input pulse levels of 0 to  $V_{CC(typ)}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in the "AC Test Loads and Waveforms" on page 4.
- AC timing parameters are subject to byte enable signals ( $\overline{BHE}$  or  $\overline{BLE}$ ) not switching when chip is disabled. Please see application note AN13842 for further clarification.
- At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
- $t_{HZOE}$ ,  $t_{HZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the output enters a high impedance state.
- If both byte enables are toggled together, this value is 10 ns.
- The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE} = V_{IL}$ ,  $\overline{BHE}$  and/or  $\overline{BLE} = V_{IL}$ , and  $CE_2 = V_{IH}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

### Switching Waveforms

#### Read Cycle 1 (Address Transition Controlled) [17, 18]

#### Read Cycle 2 ( $\overline{OE}$ Controlled) [18, 19]

**Notes:**

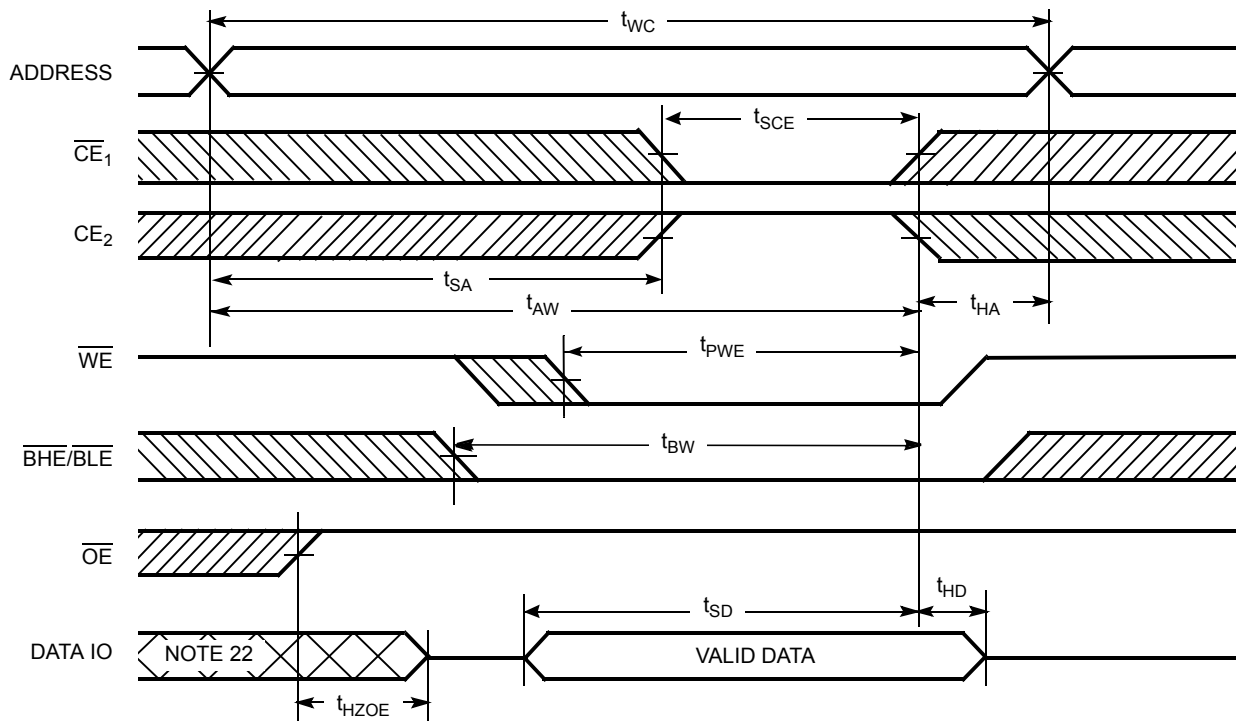

- 17. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $\overline{BHE}$  and/or  $\overline{BLE} = V_{IL}$ , and  $CE_2 = V_{IH}$ .
- 18.  $\overline{WE}$  is HIGH for read cycle.
- 19. Address valid before or similar to  $\overline{CE}_1$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  transition LOW and  $CE_2$  transition HIGH.

**Switching Waveforms** (continued)

**Write Cycle 1** ( $\overline{WE}$  Controlled) [16, 20, 21]

**Write Cycle 2** ( $\overline{CE}_1$  or  $CE_2$  Controlled) [16, 20, 21]

**Notes:**

20. Data IO is high impedance if  $\overline{OE} = V_{IH}$ .

21. If  $\overline{CE}_1$  goes HIGH and  $CE_2$  goes LOW simultaneously with  $\overline{WE} = V_{IH}$ , the output remains in a high impedance state.

22. During this period, the IOs are in output state and input signals must not be applied.

**Switching Waveforms** (continued)

**Write Cycle 3** ( $\overline{WE}$  Controlled,  $\overline{OE}$  LOW) [21]

**Write Cycle 4** ( $\overline{BHE}/\overline{BLE}$  Controlled,  $\overline{OE}$  LOW) [21]
