

**DESCRIPTION**

The MC34064 is an undervoltage sensing circuit designed specifically for use as a reset controller in microprocessor-based systems. It offers the designer an economical, space-efficient solution for low supply voltage detection when used in combination with a single pullup resistor. Adding one capacitor offers the functionality of a programmable delay time after power returns. The 34064 consists of a temperature stable reference comparator with hysteresis, high-current clamping diode and open

collector output stage capable of sinking up to 60mA. The MC34064's **RESET** output is specified to be fully functional at  $V_{IN}=1V$ . A major improvement over competing products is the glitch-free supply current during undervoltage detection. Competing products demand a step function increase in operating current during the time that you least want or need it: during power loss. See Product Highlight below.

**IMPORTANT:** For the most current data, consult *MICROSEMI*'s website: <http://www.microsemi.com>

**KEY FEATURES**

- Monitors 5V Supplies ( $V_T = 4.6V$  Typ.)
- Outputs Fully Defined At  $V_{IN} = 1V$  (See Figure 1)
- Glitch-Free Supply Current During Switching (See Product Highlight)
- Ultra-Low Supply Current (500 $\mu$ A Max.)
- Temperature Compensated ICC For Extremely Stable Current Consumption
- $\mu$ P Reset Function Programmable With 1 External Resistor And Capacitor
- Comparator Hysteresis Prevents Output Oscillation
- Electrically Compatible With Motorola MC34064
- Pin-to-Pin Compatible With Motorola MC34064 / MC34164

## ELECTRICAL CHARACTERISTICS

(Unless otherwise specified, these specifications apply over the operating ambient temperatures of  $0^\circ\text{C} = T_A = 70^\circ\text{C}$  for the MC34064 and  $-40^\circ\text{C} = T_A = 85^\circ\text{C}$  for the MC33064. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)

#### TYPICAL APPLICATION CIRCUITS

**FIGURE 15. — LOW VOLTAGE MICROPROCESSOR RESET**

A time delayed reset can be accomplished with the addition of  $C_{DLY}$ . For systems with extremely fast power supply rise times ( $< 500\text{ns}$ ) it is recommended that the  $RC_{DLY}$  time constant be greater than  $5.0\mu\text{s}$ .  $V_{TH(MPU)}$  is the microprocessor reset input threshold.

$$t_{DLY} = R C_{DLY} \ln \left[ \frac{1}{1 - \frac{V_{TH(MPU)}}{V_{IN}}} \right]$$

**FIGURE 17. — VOLTAGE MONITOR**

**FIGURE 16. — SWITCHING THE LOAD OFF WHEN BATTERY REACHES BELOW 4.3V**

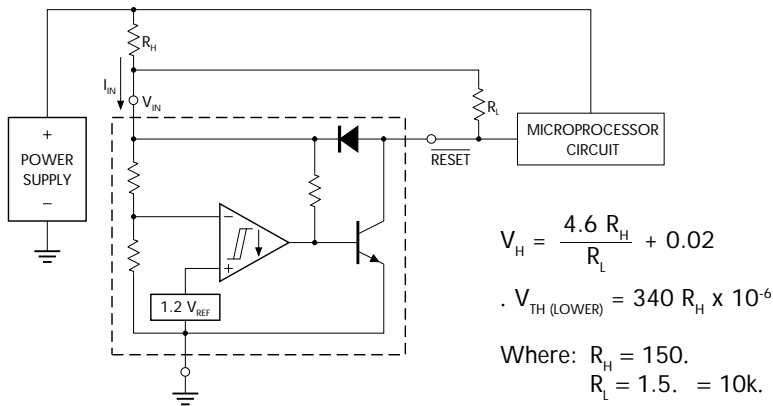

**FIGURE 18. — MOSFET LOW VOLTAGE GATE DRIVE PROTECTION**

Overheating of the logic level power MOSFET due to insufficient gate voltage can be prevented with the above circuit. When the input signal is below the 4.6 volt threshold of the MC34064, its output grounds the gate of the L<sup>2</sup> MOSFET.

#### TYPICAL APPLICATION CIRCUITS (Cont'd.)

**FIGURE 19. — LOW VOLTAGE MICROPROCESSOR RESET with ADDITIONAL HYSTERESIS**

$$V_H = \frac{4.6 R_H}{R_L} + 0.02$$

$$V_{TH(LOWER)} = 340 R_H \times 10^{-6}$$

Where:  $R_H = 150.$

$R_L = 1.5k. = 10k.$

Comparator hysteresis can be increased with the addition of resistor  $R_H$ . The hysteresis equation has been simplified and does not account for the change of input current  $I_{IN}$  as  $V_{CC}$  crosses the comparator threshold. An increase of the lower threshold  $V_{TH(LOWER)}$  will be observed due to  $I_{IN}$  which is typically  $340\mu A$  at  $4.59V$ . The equations are accurate to  $\pm 10\%$  with  $R_H$  less than  $150.$  and  $R_L$  between  $1.5k.$  and  $10k.$
