

FEATURES

- Single-supply operation: 3.3 V to 6.5 V
- Rail-to-rail input, rail-to-rail output
- High output current: 380 mA
- Low supply current: 3.9 mA
- Stable with 1 nF loads
- Wide temperature range: -40°C to $+105^{\circ}\text{C}$
- 24-lead, Pb-free, TSSOP package

APPLICATIONS

- LCD line inversion gamma references
- Car navigation panels
- Personal media player panels

GENERAL DESCRIPTION

The ADD8506 has 6-channel LCD gamma reference buffers designed to drive column driver gamma inputs in line inversion panels. Each buffer channel has an A/B input to select between two gamma voltage curves. These buffer channels drive the resistor ladders of LCD column drivers for gamma correction. The ADD8506 outputs have high slew rates and output drives that increase the stability of the reference ladder, resulting in optimal gray scale and visual performance.

The ADD8506 is specified over the -40°C to $+105^{\circ}\text{C}$ temperature range. It is available in a 24-lead thin shrink small outline (TSSOP), surface-mount, Pb-free package.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage	7 V
Input Voltage	GND to V_{CC}
Storage Temperature Range	-65°C to +150°C
Junction Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS

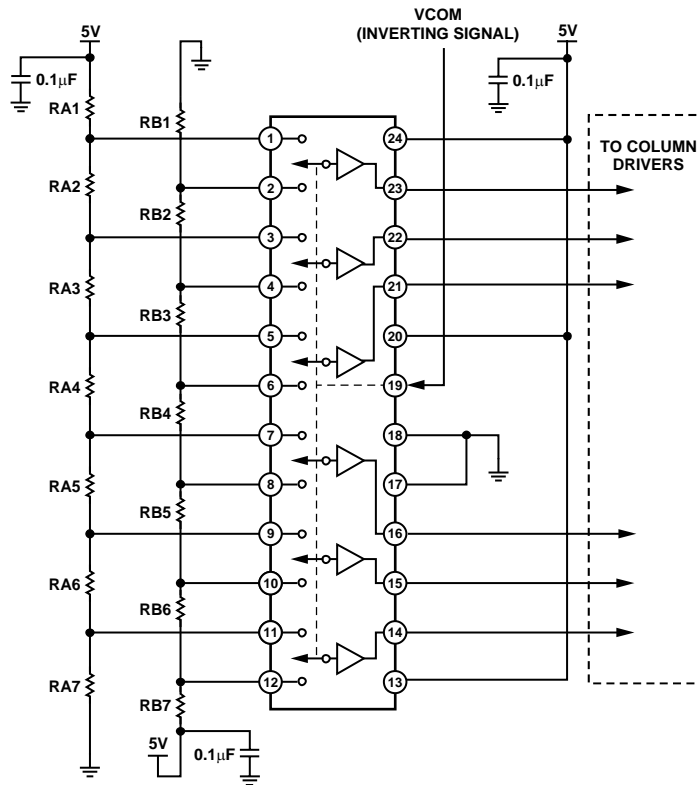

The ADD8506 has CMOS buffers with A/B inputs to select between two different reference voltages set up by an external resistor ladder. Input bias currents are orders of magnitude less than competitive parts. This allows the use of a very large resistor ladder to save supply current.

The buffer outputs are designed to drive resistive or capacitive loads. Therefore, to attain the best display performance, do not use resistors in series with these outputs. Outputs have high slew rates and 6 μ s settling times. Each output delivers a minimum of 120 mA, ensuring a fast response to varying loads.

Power supply pins on the ADD8506 have multiple ground (GND) and supply (V_{CC}) connections. Because of the high peak currents that these buffers deliver, it is recommended that all GND and V_{CC} pins be connected and suitably bypassed.
