Notes:

- 1) All voltages are referenced to V_{SS} .
- 2) I_{CC1} , I_{CC3} , I_{CC4} and I_{CC6} depend on cycle rate.
- 3) I_{CC1} and I_{CC4} depend on output loading. Specified values are obtained with the output open.
- 4) Address can be changed once or less while $RAS = V_{i1}$. In case of I_{CC4} it can be changed once or less during a page mode cycle
- 5) An initial pause of 200 μs is required after power-up followed by 8 \overline{RAS} cycles of which at least one cycle has to be a refresh cycle, before proper device operation is achieved. In case of using the internal refresh counter, a minimum of 8 \overline{CAS} -before- \overline{RAS} initialization cycles instead of 8 \overline{RAS} cycles are required.
- 6) AC measurements assume $t_T = 5$ ns.
- 7) $V_{IH (min.)}$ and $V_{IL (max.)}$ are reference levels for measuring timing of input signals. Transition times are also measured between V_{IH} and V_{IL} .
- 8) Measured with a load equivalent to 100 pF and at $V_{oh}=2.0V$ ($I_{oh}=-2mA$), $V_{ol}=0.8V$ ($I_{ol}=2mA$).
- 9) Operation within the $t_{RCD (max.)}$ limit ensures that $t_{RAC (max.)}$ can be met. $t_{RCD (max.)}$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD (max.)}$ limit, then access time is controlled by t_{CAC} .
- 10) Operation within the $t_{RAD (max.)}$ limit ensures that $t_{RAC (max.)}$ can be met. $t_{RAD (max.)}$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD (max.)}$ limit, then access time is controlled by t_{AA} .
- 11) Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- 12) $t_{OFF (max.)}$, $t_{OEZ (max.)}$ define the time at which the output achieves the open-circuit conditions and are not referenced to output voltage levels.
- 13) Either t_{DZC} or t_{DZO} must be satisfied.
- 43) Either t_{CDD} or t_{ODD} must be satisfied.
- 15) t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} > t_{WCS (min.)}$, the cycle is an early write cycle and data out pin will remain open-circuit (high impedance) through the entire cycle; if $t_{RWD} > t_{RWD (min.)}$, $t_{CWD} > t_{CWD (min.)}$ and $t_{AWD} > t_{AWD (min.)}$, the cycle is a read-write cycle and I/O will contain data read from the selected cells. If neither of the above sets of conditions is satisfied, the condition of I/O (at access time) is indeterminate.
- 16) These parameters are referenced to the \overline{CAS} leading edge in early write cycles and to the \overline{WE} leading edge in read-write cycles.
