(112 x 80-dot Graphics LCD Controller/Driver)

# **HITACHI**

**Rev 1.0** August, 2001

## **Description**

The HD66740, 112-by-80 dot-matrix graphics LCD controller and driver LSI, displays graphics such as text, kanji and pictograms. It can be configured to drive a dot-matrix liquid crystal under the control of the microprocessor connected via the clock-synchronized serial or 4/8-bit bus. The HD66740 has a smooth vertical scroll display and a double-height display for the remaining bit map areas. It fixed-displays a part of the graphics icons so that the user can easily see a variety of information.

The HD66740 has various functions to reduce the power consumption of an LCD system such as low-voltage operation of 1.8 V min., a booster to generate maximum five-times LCD drive voltage from the supplied voltage, and voltage-followers to decrease the direct current flow in the LCD drive bleeder-resistors. Combining these hardware functions with software functions such as standby and sleep modes allows fine power control. The HD66740 is suitable for any portable battery-driven product requiring long-term driving capabilities such as cellular phones, pagers, or electronic wallets.

#### **Features**

- Control and drive of a graphics LCD
- 112 x 80-dot display
- Fixed display of graphics icons (pictograms)
- Low-power operation support:
  - Vcc = 1.8 to 3.6 V (low voltage)
  - -- V<sub>LCD</sub> = 4.5 to 15.0 V (liquid crystal drive voltage)
  - Triple, quadruple, or five-times booster for liquid crystal drive voltage
  - 64-step contrast adjuster and voltage followers to decrease direct current flow in the LCD drive bleeder-resistors
  - Power-save functions such as the standby mode and sleep mode supported
  - Programmable drive duty ratios and bias values displayed on LCD
- High-speed clock-synchronized serial interface (serial transfer rate: 5 MHz max.)
- I2C bus interface
- High-speed 4-/8-bit bus interface capability
- 112-segment × 80-common liquid crystal display driver
- 1,120-byte (112 × 80 dots) character generator RAM

#### **HITACHI**

- Vertical smooth scroll
- Partial smooth scroll control (fixed display of graphics icons)
- · Vertical double-height display by each display line
- · Black-and-white reversed display
- Wide range of instruction functions:
  - Display on/off control, black-and-white reversed
- No wait time for instruction execution and RAM access
- · Internal oscillation and hardware reset
- n-raster-row AC liquid-crystal drive (C-pattern waveform drive)
- Shift change of segment and common driver
- Tape carrier package (TCP)

Table 1 Progammable Display Sizes and Duty Ratios

## **Graphics Display**

Duty Ratio	Optimum Drive Bias	Bit Map	12 x 13-dot Font Width	14 x 15-dot Font Width	16 x 16-dot Font Width
1/32	1/7	112 x 32 dots	2 lines x 9 characters	2 lines x 8 characters	2 lines x 7 characters
1/40	1/7	112 x 40 dots	3 lines x 9 characters	2.5 lines x 8 characters	2.5 lines x 7 characters
1/48	1/8	112 x 48 dots	3 lines x 9 characters	3 lines x 8 characters	3 line x 7 characters
1/56	1/8	112 x 56 dots	4 lines x 9 characters	3.5 lines x 8 characters	3.5 lines x 7 characters
1/64	1/9	112 x 64 dots	5 lines x 9 characters	4 lines x 8 characters	4 lines x 7 characters
1/72	1/9.5	112 x 72 dots	6 lines x 9 characters	4.5 lines x 8 characters	4.5 lines x 7 characters
1/80	1/10	112 x 80 dots	6 lines x 9 characters	5 lines x 8 characters	5 lines x 7 characters

<Target values>

# **Total Current Consumption Characteristics (Vcc = 3 V, TYP Conditions, LCD Drive Power Current Included)**

				Total Pow	er Consum	ption		
				Normal Di	isplay Opera	ation		
Character Display Dot Size	Duty Ratio	R-C Oscillation Frequency	Frame Frequency	Internal Logic	LCD Power	 Total*	Sleep Mode	Standby Mode
112 x 32 dots	1/32	75 kHz	73 Hz	(27 µA)	(16 µA)	Triple (75 µA)	(15 µA)	0.1 μΑ
112 x 40 dots	1/40	75 kHz	73 Hz	(27 µA)	(16 µA)	Triple (75 µA)	(15 µA)	_
112 x 48 dots	1/48	75 kHz	74 Hz	(27 µA)	(16 µA)	Triple (75 µA)	(15 µA)	_
112 x 56 dots	1/56	75 kHz	74 Hz	(27 µA)	(16 µA)	Triple (75 µA)	(15 µA)	_
112 x 64 dots	1/64	75 kHz	73 Hz	(27 µA)	(18 µA)	Quadruple (99 μA)	(15 µA)	_
112 x 72 dots	1/72	80 kHz	70 Hz	(32 µA)	(18 µA)	Quadruple (104 µA)	(15 µA)	_
112 x 80 dots	1/80	90 kHz	70 Hz	(35 μΑ)	(20 µA)	Five-times (135 µA)	(15 µA)	_

Note: When a triple, quadruple, or five-times booster is used:

the total power consumption = Internal logic current + LCD power current x 3 (triple booster), the total power consumption = Internal logic current + LCD power current x 4 (quadruple booster), and

the total power consumption = Internal logic current + LCD power current x 5 (five-times booster)

## **Type Name**

	External		
Types	Dimensions	Bus Interface	Operation Voltages
HD66740TB0	Bending TCP	4/8-bits parallel and clock synchronized serial	1.8 V to 3.6 V
HD66740WTB0	Bending TCP	4/8-bits parallel and I2C bus interface	-
HCD66740BP	Au-bumped chip	4/8-bits parallel and clock synchronized serial	-
HCD66740WBP	Au-bumped chip	4/8-bits parallel and I2C bus interface	_

## **Pin Functions**

Table 2	Pin Functional Description
	Number of

Signals	Pins	I/O	Connected to	Functions
IM2, IM1	2		GND or V <sub>cc</sub>	Selects the MPU interface mode:
				IM2 IM1 MPU interface mode
				"GND" "GND" Clock synchronized serial interface
				"GND" "Vcc" 68-system parallel interface
				"Vcc" "GND" I2C bus interface
				"Vcc" "Vcc" 80-system parallel interface
IMO/ID	1	I	GND or V <sub>cc</sub>	Selects the transfer bus length for a parallel bus interface.  GND: 8-bit bus, Vcc: 4-bit bus Inputs the ID of the device ID code for a serial bus and I2C bus interface.
CS*	1	I	MPU	Selects the HD66740: Low: HD66740 is selected and can be accessed High: HD66740 is not selected and cannot be accessed Must be fixed at GND level when not in use.
RS	1	1	MPU	Selects the register for a parallel bus interface. Low: Instruction High: RAM access
				Must be fixed at GND level when not in use.
E/WR*/SCL	1	I	MPU	For an 80-system parallel bus interface, serves as a write strobe signal and writes data at the low level. For a 68-system parallel bus interface, serves as an enable signal to activate data read/write operation. Inputs the serial transfer clock for a serial interface. Fetches data at the rising edge of a clock.
RW/RD*/ SDA	1	l or I/O	MPU	For an 80-system parallel bus interface, serves as a write strobe signal and reads data at the low level. For a 68-system parallel bus interface, serves as a signal to select data read/write operation.  Low: Write High: Read  Serves as the bidirectional serial transfer data for a serial interface. Sends/Receives data.

<b>HD6674</b>	0			
Table 2	Pin Function	onal De	scription (cont)	
Signals	Pins	I/O	Connected to	Functions
DB0-DB7	8	I/O or I	MPU	Serves as a bidirectional data bus for a parallel bus interface. For a 4-bit bus, data transfer uses DB7-DB4
				Must be fixed at GND level when serial interface mod is used.
COM1/80- COM80/1	80	0	LCD	Common output signals for graphics display: COM1 to COM8 for the first line, COM9 to COM16 for the second line, COM17 to COM24 for the third line, COM25 to COM32 for the fourth line, and COM73 to COM80 for the 10th line. All the unused pins output unselected waveforms. In the sleep mode (SLP = 1) of standby mode (STB = 1), all pins output GND level. The CMS bit can change the shift direction of the common signal. For example, if CMS = 0, COM1/80 is COM1. If CMS = 1, COM1/80 is COM80. Note that the start position of the common output (the first line) is shifted by CN1–CN0 bits.
SEG1/112- SEG112/1	112	0	LCD	Segment output signals for graphics display. In the sleep mode (SLP = 1) or standby mode (STB = 1), all pins output GND level.  The SGS bit can change the shift direction of the segment signal. For example, if SGS = 0, SEG1/112 SEG1. If SGS = 1, SEG1/112 is SEG112.
V1OUT–V5 OUT	5	I or O	Open or external bleeder-resistor	Used for output from the internal operational amplifier when they are used (OPOFF = GND); attach a capacitor to stabilize the output. When the amplifiers are not used (OPOFF = $V_{\rm CC}$ ), V1 to V5 voltages can be supplied to these pins externally.
V <sub>LCD</sub>	3	_	Power supply	Power supply for LCD drive. $V_{LCD}$ – GND = 15 V max.
V <sub>cc</sub> , GND	12	_	Power supply	V <sub>cc</sub> : +1.8 V to +3.6 V; GND (logic): 0 V
OSC1, OSC2	2	I or O	Oscillation- resistor or clock	For R-C oscillation using an external resistor, connect an external resistor. For external clock supply, inpur clock pulses to OSC1.
Vci	5	I	Power supply	Inputs a reference voltage and supplies power to the booster; generates the liquid crystal display drive voltage from the operating voltage. The boosting output voltage must not be larger than the absolute maximum ratings.  Must be left disconnected when the booster is not used.
VLOUT	3	0	V <sub>LCD</sub> pin/booster capacitance	Potential difference between Vci and GND is triple- to five-times-boosted and then output. Magnitude of boost is selected by instruction.

				HD66740
Table 2	Pin Functi	onal D	escription (cont)	
Signals	Pins	I/O	Connected to	Functions
C1+, C1–	8	_	Booster capacitance	External capacitance should be connected here for boosting.
C2+, C2-	6	_	Booster capacitance	External capacitance should be connected here when using the triple or more booster.
C3+, C3–	6	_	Booster capacitance	External capacitance should be connected here when using the quadruple and five-times booster.
C4+, C4–	6	_	Booster capacitance	External capacitance should be connected here when using the five-times booster.
RESET*	1	I	MPU or external R-C circuit	Reset pin. Initializes the LSI when low.
OPOFF	1	I	V <sub>cc</sub> or GND	Turns the internal operational amplifier off when OPOFF = $V_{CC}$ , and turns it on when OPOFF = GND. If the amplifier is turned off (OPOFF = $V_{CC}$ ), V1 to V5 must be supplied to the V1OUT to V5OUT pins.
VccDUM	1	0	Input pins	Outputs the internal $V_{\text{cc}}$ level; shorting this pin sets the adjacent input pin to the $V_{\text{cc}}$ level.
GNDDUM	1	0	Input pins	Outputs the internal GND level; shorting this pin sets the adjacent input pin to the GND level.
Dummy	5	_	_	Dummy pad. Must be left disconnected.
TEST	1	ı	GND	Test pin. Must be fixed at GND level.
VTEST1	1	I	GND or V <sub>cc</sub>	Adjusts the driving capability of the internal operationa amplifier for the LCD. This signal enters the normal drive mode in the GND side, and it enters the high-power drive mode in the $V_{\rm cc}$ side. When the display quality is not sufficient, use the high-power drive mode even though the power-consumption current is large.
VTEST2	1	_	_	Test pin. Must be left disconnected.
VTEST3	1	I	V <sub>cc</sub> or GND	Adjusts the driving capability of the internal operationa amplifier for the LCD. This signal enters the normal drive mode or high-power mode in the GND side according to the VTEST1 pin setting, and it enters the low-power drive mode in the $\rm V_{cc}$ side. Use this signa in the low-power mode so that the display quality is no lowered.

## **Block Function Description**

#### **System Interface**

The HD66740 has six types of system interfaces, and a clock-synchronized serial, an I2C bus interface, a 68-system 4-bit/8-bit bus, and a 80-system 4-bit/8-bit bus. The interface mode is selected by the IM2-0 pins.

The HD66740 has two 8-bit registers: an instruction register (IR) and a data register (DR).

The IR stores instruction codes, such as clear display, display control, and address information for the display character generator RAM (CGRAM).

The DR temporarily stores data to be written into the CGRAM. Data written into the DR from the MPU is automatically written into the CGRAM by internal operation. When address information is written into the IR, data is read and then stored in the DR from the CGRAM by internal operation. Data is read through the DR when reading from the RAM, and the first read data is invalid and the second and the following data are normal. After reading, data in the CGRAM at the next address is sent to the DR for the next reading from the MPU.

Execution time for instruction excluding clear display is 0 clock cycle and instructions can be written in succession.

 DR write as an internal operation (DR to CGRAM)

DR read as an internal operation (CGRAM to DR)

## Address Counter (AC)

1

1

The address counter (AC) assigns addresses to the CGRAM. When an address set instruction is written into the IR, the address information is sent from the IR to the AC.

After writing into the CGRAM, the AC is automatically incremented by 1 (or decremented by 1). After reading from the data, the RDM bit automatically updates or does not update the AC.

#### **Character Generator RAM (CGRAM)**

The CGRAM serves as a RAM to store 112 x 80-dot bit pattern data in the graphics display mode. Here, display patterns are directly written into CGRAM. For details, see the Graphics Display section.

#### **Timing Generator**

The timing generator generates timing signals for the operation of internal circuits such as the CGRAM. The RAM read timing for display and internal operation timing by MPU access are generated separately to avoid interference with one another. This prevents flickering in areas other than the display area when writing data to the CGRAM, for example.

#### **Oscillation Circuit (OSC)**

The HD66740 can provide R-C oscillation simply through the addition of an external oscillation-resistor between the OSC1 and OSC2 pins. The appropriate oscillation frequency for operating voltage, display size, and frame frequency can be obtained by adjusting the external-resistor value. Clock pulses can also be supplied externally. Since R-C oscillation stops during the standby mode, current consumption can be reduced. For details, see the Oscillation circuit section.

#### **Liquid Crystal Display Driver Circuit**

The liquid crystal display driver circuit consists of 80 common signal drivers (COM1 to COM80) and 112 segment signal drivers (SEG1 to SEG112). When the number of lines are selected by a program, the required common signal drivers automatically output drive waveforms, while the other common signal drivers continue to output unselected waveforms.

Graphics data is sent serially through a 112-bit shift register and latched when all needed data has arrived. The latched data then enables the segment signal drivers to generate drive waveform outputs.

The shift direction of 112-bit data can be changed by the SGS bit. The shift direction for the common driver can also be changed by the CMS bit by selecting an appropriate direction for the device mounting configuration.

When display is off, or during the standby or sleep mode, all the above common and segment signal drivers output the GND level, halting the display.

## **Booster (DC-DC Converter)**

The booster generates triple, quadruple, or five-times voltage input to the Vci pin. With this, both the internal logic units and LCD drivers can be controlled with a single power supply. Boost output level from triple to five-times boost can be selected by software. For details, see the Power Supply for Liquid Crystal Display Drive section.

#### V-Pin Voltage Follower

A voltage follower for each voltage level (V1 to V5) reduces current consumption by the LCD drive power supply circuit. No external resistors are required because of the internal bleeder-resistor, which generates different levels of LCD drive voltage. This internal bleeder-resistor can be software-specified from 1/4 bias to 1/10 bias, according to the liquid crystal display drive duty value. The voltage followers can be turned off while multiplexing drive is not being used. For details, see the Power Supply for Liquid Crystal Display Drive section.

#### **Contrast Adjuster**

The contrast adjuster can be used to adjust LCD contrast in 64 steps by varying the LCD drive voltage by software. This can be used to select an appropriate LCD brightness or to compensate for temperature.

Notes: 1. A set bit in CGRAM data 1 corresponds to display selection (lit) and 0 to non-selection (unlit).

## **Instructions**

## **Outline**

Only the instruction register (IR) and the data register (DR) of the HD66740 can be controlled by the MPU. Before starting internal operation of the HD66740, control information is temporarily stored in these registers to allow interfacing with various peripheral control devices or MPUs which operate at different speeds. The internal operation of the HD66740 is determined by signals sent from the MPU. These signals, which include the register selection signal (RS), the read/write signal (R/W), and the data bus signal (DB0 to DB7), make up the HD66740 instructions. There are four categories of instructions that:

- · Control the display
- Control power management
- Set internal RAM addresses
- Transfer data with the internal RAM

Normally, instructions that perform data transfer with the internal RAM are used the most. However, auto-incrementation by 1 (or auto-decrementation by 1) of internal HD66740 RAM addresses after each data write can lighten the MPU program load.

Because instructions are executed in 0 cycle, instructions can be written in succession.

## **Instruction Descriptions**

## **Start Oscillation**

The start oscillation instruction restarts the oscillator from the halt state in the standby mode. After issuing this instruction, wait at least 10 ms for oscillation to stabilize before issuing the next instruction. (See the Standby Mode section.)

Figure 1 Start Oscillation Instruction

## **Driver Output Control**

**CMS:** Selects the output shift direction of a common driver. When CMS = "0", COM1/80 shifts to COM1, and COM80/1 to COM80. When CMS = "1", COM1/80 shifts to COM80, and COM80/1 to COM1. Output position of a common driver shifts depending on the CN1–0 bit setting. For details, see the Display On/Off Control section.

**SGS:** Selects the output shift direction of a segment driver. When SGS = "0", SEG1/112 shifts to SEG1, and SEG112/1 to SEG112. When SGS = "1", SEG1/112 shifts SEG112, and SEG112/1 to SEG1.

Figure 2 Driver Output Control Instruction

#### **Power Control**

**AMP:** When AMP = 1, each voltage follower for V1 to V5 pins and the booster are turned on. When AMP = 0, current consumption can be reduced while the display is not being used.

**SLP:** When SLP = 1, the HD66740 enters the sleep mode, where the internal operations are halted except for the R-C oscillator, thus reducing current consumption. For details, see the Sleep Mode section. Only the power control (AMP, SLP, and STB bits) instruction can be executed during the sleep mode.

During the sleep mode, the other RAM data and instructions cannot be updated although they are retained.

**STB:** When STB = 1, the HD66740 enters the standby mode, where display operation completely stops, halting all the internal operations including the internal R-C oscillator. Further, no external clock pulses are supplied. For details, see the Standby Mode section.

Only the following instructions can be executed during the standby mode.

- a. Standby mode cancel (STB = 0)
- b. Voltage follower circuit on/off (AMP = 1/0)
- c. Start oscillation

During the standby mode, the other RAM data and instructions may be lost. To prevent this, they must be set again after the standby mode is canceled.

Figure 3 Power Control Instruction

#### **Contrast Control 1/2**

**SW:** Switches the bit configuration for the contrast control instruction.

**CT4–CT0:** When SW = 0, they control the LCD drive voltage (potential difference between V1 and GND) to adjust contrast. A 64-step adjustment is also possible by using the CT5 bit which are set in the entry mode register. For details, see the Contrast Adjuster section.

1	0	0	0	1	0	1.50 x R
			•			•
			•			•
1	1	1	1	0	1	0.15 x R
1	1	1	1	1	0	0.10 x R
1	1	1	1	1	1	0.05 x R

**BT1-0:** When SW = 1, they switch the output of V5OUT between triple, quadruple, and five-times boost. The liquid crystal display drive voltage level can be selected according to its drive duty ratio and bias. A lower amplification of the booster consumes less current.

**BS2-0:** When SW = 1, they set the crystal display drive bias value within the range of 1/4 to 1/10 bias. The liquid crystal display drive bias value can be selected according to its drive duty ratio and voltage. For details, see the Liquid Crystal Display Drive Bias Selector section.

Table 7 BT Bits and Output Level

BT1	BT0	V5OUT Output Level
0	0	Triple boost
0	1	Quadruple boost
1	0	Five-times boost
1	1	Setting inhibited

				HD66740
Table 8	BS Bit	s and LCD	Drive Bias Value	
BS2	BS1	BS0	Liquid Crystal Display Drive Bias Value	
0	0	0	1/10 bias drive	
0	0	1	1/9.5 bias drive	
0	1	0	1/9 bias drive	
0	1	1	1/8 bias drive	
1	0	0	1/7 bias drive	
1	0	1	1/6 bias drive	
1	1	0	1/5 bias drive	
1	1	1	1/4 bias drive	

## **Entry Mode**

**REV:** Displays all graphics display sections with black-and-white reversal when SW = 0 and REV = 1. For details, see the Reversed Display Function section.

**I/D:** When SW = 0, increments (I/D = 1) or decrements (I/D = 0) the CGRAM address by 1 when a data is written into or read from the CGRAM.

CT5: Sets the most significant bit (CT5) for contrast adjustment when SW = 1. A 64-step adjustment is also possible by using the CT4–CT0 bits which are set in the contrast-control 1/2 instruction.

**RDM:** When SW = 1 and RDM = 0, the RDM increments or decrements the address counter value according to the I/D bit setting after reading the data from the CGRAM. When RDM = 1, the address counter value is not updated after the data has been read from the CGRAM. The address counter value is used when the RAM data is read, modified, and written. Since the first read data is invalid, the read must be continuously done twice. After writing to the RAM, the address counter value must be updated.

Figure 6 Entry Mode Set Instruction

## **Display On/Off Control**

**D:** Display is on when SW = 0 and D = 1 and off when D = 0. When off, the display data remains in the DDRAM or CGRAM, and can be displayed instantly by setting D = 1. When D is 0, the display is off with the SEG1 to SEG112 outputs and COM1 to COM80 outputs set to the GND level. Because of this, the HD66740 can control charging current for the LCD with AC driving.

**DL10:** When SW = 0, DL10 can be set. When DL10 = 1, the 10th line is displayed at double height.

**DL9–DL7:** When SW = 1, DL9-DL7 can be set. Double-height display is specified for any display line. When DL7 = 1, the seventh line is displayed at double height. Double-height display is used for the eighth line when DL8 = 1 and for the ninth line when DL9 = 1. For double-height display for the first to the sixth lines, control them by using DL1-DL6 bits in the display-line control instruction.

Figure 7 Display On/Off Control Instruction

#### **Display Line Control**

**NL3-0:** Set NL2-NL0 bits when SW = 0, and the NL3 bit when SW = 1 to specify the display lines. Display lines change the liquid crystal display drive duty ratio. CGRAM address mapping does not depend on the number of display lines.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	0	1	1	1				(SW = 0) (SW = 1)

Figure 8 Display-line Control Instruction

Table 9 NL Bits and Display Lines

NL3	NL2	NL1	NL0	Graphics Display	LCD Drive Duty	Common Driver Used
0	0	0	0	112 x 8 dots	1/8 Duty	COM1-COM8
0	0	0	1	112 x 16 dots	1/16 Duty	COM1-COM16
0	0	1	0	112 x 24 dots	1/24 Duty	COM1-COM24
0	0	1	1	112 x 32 dots	1/32 Duty	COM1-COM32
0	1	0	0	112 x 40 dots	1/40 Duty	COM1-COM40
0	1	0	1	112 x 48 dots	1/48 Duty	COM1-COM48
0	1	1	0	112 x 56 dots	1/56 Duty	COM1-COM56
0	1	1	1	112 x 64 dots	1/64 Duty	COM1-COM64
1	0	0	0	112 x 72 dots	1/72 Duty	COM1-COM72
1	0	0	1	112 x 80 dots	1/80 Duty	COM1-COM80

**CN1–CN0:** Set CN1–CN0 bits when SW = 1. When CN1–0 = 01, the display position is shifted by 16 dots below and display starts from COM17. When the liquid crystal is driven at low duty in the system wait state, it can display partially at the center of the screen. For details, see the Partial-display-on Function section.

When CN1-CN0=10, the display position is shifted by 8 dots above and second-line display starts from COM1. The 8 dots of the first line are moved to the lowest edge of the display screen. The output position of the lowest edge depends on the drive duty setting. In vertical smooth scrolling, PS1-PS0 bits can selectively fixed-display only the first to the third lines. Combining these functions enables the fixed display of one line of the lowest edge. For details, see the Partial Smooth Scroll Display Function section.

## **Double-height Display Control**

**DL3-1:** Can be specified when SW = 0. Specify the double-height display for any line. When DL1 = 1, the first line is displayed at double height. When DL2 = 1, the second line is displayed at double

height. When DL3 = 1, the third line is displayed at double height. Double-height display of multiple lines is possible. For details, see the Double-height Display section.

**DL6-4:** Can be specified when SW = 1. Specify the double-height display for any line. When DL4 = 1, the fourth line is displayed at double height. When DL5 = 1, the fifth line is displayed at double height. When DL6 = 1, the sixth line is displayed at double height. For the seventh to 10th lines, control double-height display by using the DL7-DL10 bits in the display-line control instruction. For details, see the Double-height Display section.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	1	0	0	0	DL3 DL6	DL2 DL5	DL1 DL4	(SW = 0) (SW = 1)

Figure 9 Double-height Display Control Instruction

#### Vertical Scroll Control 1/2

SN3-0: Set SN2 to SN0 bits when SW = 0. Set the SN3 bit when SW = 1. Specify the display start line output from COM1. Because the CGRAM is assigned a 10-line display area, the data is displayed sequentially from the first line to the 10th line then repeated from the first line again. In partial smooth scrolling, these bits specify the display start line for the next line of the fixed-display line. For details, see the Partial Smooth Scroll Display Function section.

**SL2–0:** Select the top raster-row to be displayed (display-start raster-row) in the display-start line specified by SN2 to SN0. Any raster-row from the first to eighth can be selected (table 12). This function is used to achieve vertical smooth scrolling together with SN2 to SN0. For details, see the Vertical Smooth Scroll section.

R	R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DBC
	0	0	0	1	0	0	1	SN2 <0>	SN1 <0>	SN0 SN3
	0	0	0	1	0	1	0	SL2 <0>	SL1 PS1	SL0 PS0

Figure 10 Vertical Scroll Control 1/2 Instruction

Table 11 SN Bits and Display-start Lines

SN3	SN2	SN1	SN0	Display-start Line
0	0	0	0	1st line
0	0	0	1	2nd line
0	0	1	0	3rd line
0	0	1	1	4th line
0	1	0	0	5th line
0	1	0	1	6th line
0	1	1	0	7th line
0	1	1	1	8th line
1	0	0	0	9th line
1	0	0	1	10th line

Table 12 SL Bits and Display-start Raster-row

SL2	SL1	SL0	Display-start Raster-row
0	0	0	1st raster-row
0	0	1	2nd raster-row
0	1	0	3rd raster-row
0	1	1	4th raster-row
1	0	0	5th raster-row
1	0	1	6th raster-row
1	1	0	7th raster-row
1	1	1	8th raster-row

**PS1–0:** Specify PS1 to PS0 bits when SW = 1. When PS1–0 = 01, only the first line is fixed-displayed in vertical smooth scrolling, and the other display lines are smooth-scrolled. When PS1–0 = 10, the first and second lines are fixed-displayed. When PS1–0 = 11, the first to third lines are fixed-displayed. For details, see the Partial Smooth Scroll Display Function section.

## **LCD-Driving-Pattern Control**

**B/C:** When SW=1 and B/C=0, a B-pattern waveform is generated and alternates in every frame for LCD drivin. When B/C=1, a C-pattern wavefrom is generated and alternates (n-raster-row reversed AC drive) in each raster-row specified by bits EOR and NW4-NW0 in the LCD-driving-waveform control register. For details, see the n-raster-row Reversed AC Drive section.

**DCC:** When SW=1 and DCC=0, a booster operates with the 64-divided clock of the operating frequency. When DCC=1, the booster operates with the 32-divided clock. When the booster operates with the 64-divided clock, current consumption the booster is low, but boosting ability is weak.

Figure 10a LCD-Driving-Waveform Control Instruction

## **LCD-Driving-Waveform Control**

**EOR:** When the C-pattern waveform is set (B/C = 1) and SW = 1 and EOR = 1, the odd/even frame-select signals and the n-raster-row reversed signals are EORed for alternating drive. EOR is used when the LCD is not alternated by combining the set values of the LCD drive duty ratio and n raster-row. For details, see the n-raster-row Reversed AC Drive section.

**NW4–0:** Specify the number of raster-rows n that will alternate at the C-pattern waveform setting (B/C = 1). NW4–NW0 alternate in every set value +1 raster-row, and the first to the 32nd raster-rows can be selected. When SW = 0, bits NW2, NW1, and NW0 can be set. When SW = 1, bits NW4 and NW3 can be set.

											HD66740
R/V	/ RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
0	0	0	1	1	1	1	NW2 EOR	NW1 NW4	NW0 NW3	(SW = 0) (SW = 1)	

Figure 11 LCD-Driving-Waveform Control Instruction

#### **RAM Address Set**

**AD10-0:** Initially set RAM addresses to the address counter (AC). Once the RAM data is written, the AC is automatically updated according to the I/D bit. This allows consecutive accesses without resetting addresses. Once the RAM data is read, the AC is automatically updated according to the I/D bit when RDM = 0, and not updated when RDM = 1. Set RDM to 1 when read, modify, and write are done in every one-byte data. RAM address setting is not allowed in the sleep mode or standby mode.

R/W	RS	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	AD10	AD9	AD8	AD7	AD6
0	0	1	1	AD5	AD4	AD3	AD2	AD1	AD0

Figure 12 RAM Address Set Instruction

Table 13 AD Bits and CGRAM Settings

AD10-AD0	CGRAM Setting
"000"H-"06F"H	Bit map data for COM1 to COM8
"080"H-"0EF"H	Bit map data for COM9 to COM16
"100"H-"16F"H	Bit map data for COM17 to COM24
"180"H-"1EF"H	Bit map data for COM25 to COM32
"200"H-"26F"H	Bit map data for COM33 to COM40
"280"H-"2EF"H	Bit map data for COM41 to COM48
"300"H-"36F"H	Bit map data for COM49 to COM56
"380"H-"3EF"H	Bit map data for COM57 to COM64
"400"H–"46F"H	Bit map data for COM65 to COM72
"480"H-"4EF"H	Bit map data for COM73 to COM80

#### Write Data to RAM

**WD7-0**: Write 8-bit data to the CGRAM. After a write, the address is automatically incremented or decremented by 1 according to the I/D bit setting. During the sleep and standby modes, the CGRAM cannot be accessed.

Figure 13 Write Data to RAM Instruction

#### Read Data from RAM

**RD7-0:** Read 8-bit data from the CGRAM. In the parallel bus interface mode, the first-byte data read will be invalid immediately after the RAM address set, and the consecutive second-byte data will be read normally. In the serial interface mode or I2C bus interface mode, two bytes will be invalid immediately after the start byte, and the consecutive third-byte data will be read normally. For details, see the Serial Data Transfer section.

After a RAM read, when RDM = 0, the address is automatically incremented or decremented by 1 according to the I/D bit. When RDM = 1, the address is not updated.

SL2-0: Display-start raster-row specifications (000: 1st raster-row...111: 8th raster-row)

CN1-0 Centering specifications (00: no centering, 01: 16-dot shift below, 10: 8-dot shift above)

B/C = 0: B-pattern waveform drive B/C = 1: C-pattern waveform drive

EOR = 1: EOR alternating drive at C-pattern waveform

NW4–0: Reversed number of n raster-rows at C-pattern waveform drive (alternating with the set value + one raster-row)

DCC = 0: Boosted at 1/64-divided clock DCC = 1: Boosted at 1/32-divided clock

AD10-0: CGRAM address set (CGRAM: 000H-4EFH)

#### **Reset Function**

The HD66740 is internally initialized by RESET input. The reset input must be held for at least 1 ms.

#### **Instruction Set Initialization:**

- 1. Start oscillation executed
- 2. Driver output control (SGS = 0, CMS = 0)
- 3. Power control (AMP = 0: LCD power off, SLP = 0: Sleep mode off, STB = 0: Standby mode off)
- 4. Three times boost (BT1/0 = 00), 1/10 bias drive (BS2/1/0 = 000), Weak contrast (CT5-0 = 00000)
- 5. Entry mode set (REV = 0: Normal display, I/D = 1: Increment by 1, RDM = 0: Automatically update after reading)
- 6. Display on/off control (D = 0: Display off, CEN = 0: Normal position)
- 7. Display line control (NL3/2/1/0 = 1001: 1/80 duty ratio)
- 8. Double-height display off (DL10-1 = 0000000000)
- 9. Vertical scroll control (SN3/2/1/0 = 0000: First line displayed at the top, SL2/1/0: First raster-row displayed at the top of the first line, PS1/0 = 00: Partial scroll off)
- 10. 1/64-divided clock boost (DCC = 0)
- 11. B-pattern waveform AC drive (B/C = 0, EOR = 0, NW4/3/2/1/0 = 00000)

#### **RAM Data Initialization:**

#### 1. CGRAM

This is not automatically initialized by reset input but must be initialized by software while display is off (D = 0).

## **Output Pin Initialization:**

- 1. LCD driver output pins (SEG/COM): Outputs GND level
- 2. Booster output pins (VLOUT): Outputs GND level
- 3. Oscillator output pin (OSC2): Outputs oscillation signal

#### **Serial Data Transfer (Clock synchronized serial interface)**

Setting the IM1 and IM2 pins (interface mode pins) to the GND level allows standard clock-synchronized serial data transfer, using the chip select line (CS\*), serial data line (SDA), and serial transfer clock line (SCL). For a serial interface, the IM0/ID pin function uses an ID pin.

The HD66740 initiates serial data transfer by transferring the start byte at the falling edge of CS\* input. It ends serial data transfer at the rising edge of CS\* input.

The HD66740 is selected when the 6-bit chip address in the start byte transferred from the transmitting device matches the 6-bit device identification code assigned to the HD66740. The HD66740, when selected, receives the subsequent data string. The least significant bit of the identification code can be determined by the ID pin. The five upper bits must be 01110. Two different chip addresses must be assigned to a single HD66740 because the seventh bit of the start byte is used as a register select bit (RS): that is, when RS = 0, an instruction can be issued, and when RS = 1, data can be written to or read from RAM. Read or write is selected according to the eighth bit of the start byte (R/W bit) as shown in table 16.

After receiving the start byte, the HD66740 receives or transmits the subsequent data byte-by-byte. The data is transferred with the MSB first.

Two bytes of RAM read data after the start byte are invalid. The HD66740 starts to read correct RAM data from the third byte.

**Table 15** Start Byte Format

Transfer Bit	S	1	2	3	4	5	6	7	8
Start byte format	Transfer start	Device ID code						RS	R/W
		0	1	1	1	0	ID		

Note: ID bit is selected by the IM0/ID pin.

Table 16 RS and R/W Bit Function

RS	R/W	Function
0	0	Writes instruction
0	1	-
1	0	Writes RAM data
1	1	Reads RAM data

Figure 16 Clock-synchronized Serial Interface Timing Sequence

#### **Serial Data Transfer (I2C bus interface)**

Setting the IM2=Vcc and IM1=GND level allows I2C bus interface, using the serial data line (SDA) and serial transfer clock line (SCL). For the I2C bus interface, the IM0/ID pin function uses an ID pin.

The HD66740W is initiated serial data transfer by transferring the first byte when a high SCL level at the falling edge of the SDA input is sampled; it ends serial data transfer when a high SCL level at the rising edge of the SDA input is sampled.

Table 16-a illustrates the start byte of I2C bus interface data and Figure 16-a and 16-b show the I2C bus interface timing sequence.

The HD66740W is selected when the higher 6-bit slave address in the first byte transferred from the master device match the 6-bits device identification code assigned to the HD66740W. The HD66740W, when selected, receive the subsequent data string. The lower 1-bit of the device identification code can be determined by the ID pin; select an appropriate code that is not assigned to any other slave device. The upper five bits are fixed to 01110. One slave address is assigned to a single HD66740W.

The ninth bit of the first byte is a receive-data acknowledge bit (ACK). When the received slave address matches the device ID code, HD66740W pulls down the ACK bit to a low level. Therefore, the ACK output buffer is an open-drain structure, only allowing low-level output. However, the ACK bit is undermined immediately after power-on; make sure to initialize the LSI using the RESET\* input.

After identifying the address in the first byte, the HD66740W receives the subsequent data as an HD66740W instruction or as RAM data. Having received 8-bit data normally, HD66740W pulls down the ninth bit (ACK) to a low level. The instruction or RAM data is 8-bits data format.

Two bytes of RAM read data after the start byte are invalid. The HD66740W start to read correct RAM data from third byte.

Table 16-a Start Byte Format

Transfer Bit	S	1	2	3	4	5	6	7	8	9
Start byte format	Transfer start		Device ID code							ACK
		0 1 1 1 0 ID								

Note:  $\,$  ID bit is selected by the IM0/ID pin.

RS	R/W	Function
0	0	Writes instruction
0	1	-
1	0	Writes RAM data
1	1	Reads RAM data

Figure 16-a I2C bus interface data-receive sequence

Figure 16-b I2C bus interface data-send sequence

#### **Parallel Data Transfer**

#### 8-bit Bus Interface

Setting the IM2/1/0 (interface mode) to the GND/Vcc/GND level allows E-clock-synchronized 8-bit parallel data transfer. Setting the IM2/1/0 (interface mode) to the Vcc/Vcc/GND level allows 80-system 8-bit parallel data transfer. When the number of buses or the mounting area is limited, use a 4-bit bus interface or serial data transfer.

Figure 17 Interface to 8-bit Microcomputer

#### 4-bit Bus Interface

Setting the IM2/1/0 (interface mode) to the GND/Vcc/Vcc level allows E-clock-synchronized 4-bit parallel data transfer using pins DB7-DB4. Setting the IM2/1/0 (interface mode) to the Vcc/Vcc/Vcc level allows 80-system 4-bit parallel data transfer. The 8-bit instructions and RAM data are divided into four upper/lower bits and the transfer starts from the upper four bits.

Note: Transfer synchronization function for a 4-bit bus interface

The HD66740 supports the transfer synchronization function which resets the upper/lower counter to count upper/lower 4-bit data transfer in the 4-bit bus interface. Noise causing transfer mismatch between the four upper and lower bits can be corrected by a reset triggered by consecutively writing a 0000 instruction four times. The next transfer starts from the upper four bits. Executing synchronization function periodically can recover any runaway in the display system.

Figure 18 4-bit Transfer Synchronization

#### **Oscillation Circuit**

The HD66740 can either be supplied with operating pulses externally (external clock mode) or oscillate using an internal R-C oscillator with an external oscillator-resistor (external resistor oscillation mode). Note that in R-C oscillation, the oscillation frequency is changed according to the internal capacitance value, the external resistance value, or operating power-supply voltage. Insert the dumping registance of about  $1.5 \mathrm{k}\Omega$  to prevent malfunctions caused by over-shoot or under-shoot noise in the external clock mode.

Figure 19 Oscillation Circuits

Table 17 Relationship between Drive Duty Ratio and Frame Frequency (fosc = 75 kHz)

	Display	y mode										
	1-line Dis- play	2-line Dis- play	3-line Dis- play	4-line Dis- play	5-line Dis- play	6-line Dis- play	7-line Dis- play	8-line Dis- play	9-line Dis- play	10-line Dis- play		
	Set val	Set value for NL3-0										
LCD Drive	0000	0001	0010	0011	0100	0101	0110	0111	1000	1001		
Multiplexing duty ratio	1/8	1/16	1/24	1/32	1/40	1/48	1/56	1/64	1/72	1/80		
Drive bias (recommend- ed value)	1/4	1/5	1/6	1/6	1/7	1/8	1/8	1/9	1/9.5	1/10		
Frame frequency	73 Hz	73 Hz	73 Hz	73 Hz	72 Hz	74 Hz	74 Hz	73 Hz	65 Hz	59 Hz		
One-frame frequency	1,024	1,024	1,032	1,024	1,040	1,008	1,008	1,024	1,152	1,280		

Note: If the frame frequency is low and the display flickers, increase the oscillation frequency (fosc).

Particularly in the 9-line display and 10-line display modes, note that the frame frequency is lowered.

Figure 20 LCD Drive Output Waveform (B-pattern AC Drive with 1/80 Multiplexing Duty Ratio)

#### n-raster-row Reversed AC Drive

The HD66740 supports not only the LCD reversed AC drive in a one-frame unit (B-pattern waveform) but also the n-raster-row reversed AC drive which alternates in an n-raster-row unit from one to 32 raster-rows (C-pattern waveform). When a problem affecting display quality occurs, such as crosstalk at high-duty driving of more than five lines (1/40 duty), the n-raster-row reversed AC drive (C-pattern waveform) can improve the quality. Determine the number of raster-rows n (NW bit set value + 1) for alternating after confirmation of the display quality with the actual LCD panel. However, if the number of AC raster-rows is reduced, the LCD alternating frequency becomes high. Because of this, the charge or discharge current is increased in the LCD cells.

Figure 21 Example of an AC Signal under n-raster-row Reversed AC Drive

#### Liquid Crystal Display Voltage Generator

#### When External Power Supply and Internal Operational Amplifiers are Used

To supply LCD drive voltage directly from the external power supply without using the internal booster, circuits should be connected as shown in figure 22. Here, contrast can be adjusted by software through the CT bits of the contrast adjustment register.

The HD66740 incorporates a voltage-follower operational amplifier for each V1 to V5 to reduce current flowing through the internal bleeder-resistors, which generate different levels of liquid-crystal drive voltages. Thus, potential differences between  $V_{LCD}$  and V1 and between V5 and GND must be 0.4 V or higher. Note that the OPOFF pin must be grounded when using the operational amplifiers. Place a capacitor of about 0.1  $\mu$ F to 0.5  $\mu$ F between each internal operational amplifier V1OUT to V5OUT output and GND and stabilize the output level of the operational amplifier.

Figure 22 External Power Supply Circuit for LCD Drive Voltage Generation

#### When an Internal Booster and Internal Operational Amplifiers are Used

To supply LCD drive voltage using the internal booster, circuits should be connected as shown in figure 23. Here, contrast can be adjusted through the CT bits of the contrast control instruction. Temperature can be compensated either through the CT bits or by controlling the reference voltage for the booster (Vci pin) using a thermistor.

Note that Vci is both a reference voltage and power supply for the booster. The reference voltage must therefore be adjusted using an emitter-follower or a similar element so that sufficient current can be supplied. In this case, Vci must be equal to or smaller than the  $V_{CC}$  level.

The HD66740 incorporates a voltage-follower operational amplifier for each of V1 to V5 to reduce current flowing through the internal bleeder-resistors, which generate different liquid-crystal drive voltages. Thus, the potential differences between  $V_{LCD}$  and V1 and between V5 and GND must be 0.4 V or higher.

Note that the OPOFF pin must be grounded when using the operational amplifiers. Place a capacitor of about  $0.1~\mu F$  to  $0.5~\mu F$  between each internal operational amplifier V1OUT to V5OUT output and GND and stabilize the output level of the operational amplifier.

- Notes: 1. The reference voltage input (Vci) must be adjusted so that the output voltage after boosting will not exceed the absolute maximum rating for the liquid-crystal power supply voltage (17 V). Particularly, Vci must be 3.3 V or less for five-times boosting.
  - Voi is both a reference voltage and power supply for the booster; connect it to Vcc directly or combine it with a transistor so that sufficient current can be obtained.
  - 3. Polarized capacitors must be connected correctly.
  - 4. Circuits for temperature compensation should be based on the sample circuit in figure 24.

Figure 23 Internal Booster for LCD Drive Voltage Generation

Figure 24 Temperature Compensation Circuit

#### **Notes on Using Internal Operational Amplifier**

The HD66740 has a low-current-consumption-type operational amplifier. When a low-voltage supply is used, particularly at low temperatures near  $-20^{\circ}$ C, the current in the operational amplifier is reduced. Therefore, depending on the specifications or display pattern of the LCD panel used, screen quality may be poor or the LCD panel may not operate at all.

For the operational specifications of the LCD panel, one must consider the drive condition (setting of the VTEST pin) or the peripheral circuits of the LCD panel in conjunction with the power-supply voltage.

Pin condition for HD66740 (setting VTEST pin):

- 1. When the power-supply voltage is  $Vcc \ge 2.5 \text{ V}$  (i.e., the current in the operational amplifier is sufficient), leave the VTEST pin open (disconnected).
- 2. When the power-supply voltage is Vcc < 2.5 V (i.e., the current is reduced in the operational amplifier at low temperature), 1.2 to 1.3 V should be input to the VTEST pin.

The following table and figure correspond to inputs of 1.2 to 1.3 V to the VTEST pin. When higher LCD drive current is required due to the characteristics of the LCD panel, check the screen quality and current consumption, adjust the resistance values (R1 and R2), and increase the VTEST pin voltage. (This is also valid when  $Vcc \ge 2.5$  V.)

Figure 24-a Circuit to for Generating VTEST Pin Voltage

Table 17-a Settings to Generate VTEST Pin Voltage

Vcc	R1	R2	Vtest (VTEST Pin Voltage)
2.4 V	270 kΩ	330 kΩ	1.23 V
2.0 V	220 kΩ	360 kΩ	1.22 V
1.8 V	180 kΩ	390 kΩ	1.22 V

#### Countermeasures for Screen Quality when Using On-chip Operational Amplifier

The HD66740 is an on-chip LCD driver that has an LCD power supply for high duty. Screen quality is affected by the load current of the high-duty LCD panel used. When the bias (1/10 bias, 1/9.5 bias, 1/9 bias, etc.) is high and the displayed pattern is completely or almost completely white, the white sections may appear dark.

If this happens, execute the following countermeasures to improve screen quality.

- (1) After the change in the V4OUT/V3OUT level is verified, insert about 1  $M\Omega$  between V4OUT and GND or VLCD and V3OUT and then adjust the screen quality (see the following figures). By inserting resistance, the current consumption increases as much as the boosting factor of the resistance current. Adjust the resistance after checking the screen quality and the increase in current consumption.
- (2) Decrease the drive bias and use the new bias level after verifying that the potential differences between V4OUT and GND or VLCD and V3OUT are sufficient.

Figure 24-b Countermeasure for V4OUT Output

Figure 24-c Countermeasure for V3OUT Output

Note: The actual LCD drive voltage-VLCD used must not exceed 15.0 V, and the absolute rating must not exceed 16.0 V.

#### **Switching the Boosting Multiplying Factor**

Instruction bits (BT1/0 bits) can optionally select the boosting multiplying factor of the internal booster. According to the display status, power consumption can be reduced by changing the LCD drive duty and the LCD drive bias, and by controlling the boosting multiplying factor for the minimum requirements. For details, see the Partial-display-on Function section.

Due to the maximum boosting multiplying factor, the following external capacitor needs to be connected. For example, when the maximum boosting is quadrupled, the capacitors between C4+ and C4- for five-times boosting are not needed, so these pins must be open.

**Table 18 VLOUT Output Status** 

BT1	ВТ0	VLOUT Output Status
0	0	Triple boosting output
0	1	Quadruple boosting output
1	0	Five-times boosting output
1	1	Setting inhibited

Figure 25 Booster Output Multiplying Factor Switching

#### **Example of Power-supply Voltage Generator for More Than Five-times Boosting Output**

The HD66740 incorporates the booster for up to five-times boosting. However, the LCD drive voltage (VLCD) will not be enough for five-times boosting from Vcc when the power-supply voltage of Vcc is low or when the LCD drive voltage is high for the high-contrast LCD display. In this case, the reference voltage (Vci) for boosting can be set higher than the power-supply voltage of Vcc.

Set the Vci input voltage for the booster to  $3.6\,\mathrm{V}$  or less within the range of Vcc +  $1.0\,\mathrm{V}$ . Control the Vci voltage so that the boosting output voltage (VLOUT) should be less than the absolute maximum ratings (17 V).

Figure 26 Usage Example of Booster at Vci > Vcc

# **Contrast Adjuster**

Software can adjust 64-step contrast for an LCD by varying the liquid-crystal drive voltage (potential difference between  $V_{LCD}$  and V1) through the CT bits of the contrast adjustment register (electron volume function). The value of a variable resistor between  $V_{LCD}$  and V1 (VR) can be precisely adjusted in a 0.05 x R unit within a range from 0.05 x R through 3.20 x R, where R is a reference resistance obtained by dividing the total resistance.

The HD66740 incorporates a voltage-follower operational amplifier for each of V1 to V5 to reduce current flowing through the internal bleeder resistors, which generate different liquid-crystal drive voltages. Thus, CT5-0 bits must be adjusted so that the potential differences between  $V_{\rm LCD}$  and V1 and between V5 and GND are 0.4 V or higher when liquid-crystal drives, particularly when the VR is small.

Figure 27 Contrast Adjuster

#### **Liquid Crystal Display Drive Bias Selector**

An optimum liquid crystal display bias value can be selected using BS2-0 bits, according to the liquid crystal drive duty ratio setting (NL3-0 bits). Liquid crystal display drive duty ratio and bias value can be displayed while switching software applications to match the LCD panel display status. The optimum bias value calculated using the following expression is an ideal value where the optimum contrast is obtained. Driving by using a lower value than the optimum bias value provides lower contrast and lower liquid crystal display voltage (potential difference between V1 and GND). When the liquid crystal display voltage is insufficient even if a five-times booster is used or output voltage is lowered because the battery life has been reached, the display can be made easier to see by lowering the liquid crystal bias.

The liquid crystal display can be adjusted by using the contrast adjustment register (CT4-0 bits) and selecting the booster output level (BT1/0 bits).

Optimum bias value for 1/N duty ratio drive voltage = 
$$\frac{1}{\sqrt{N} + 1}$$

Table 21 Optimum Drive Bias Values

LCD drive duty ratio	1/80	1/72	1/64	1/56	1/48	1/40	1/32	1/24	1/16	1/8
(NL3-0 set value)	1001	1000	0111	0110	0101	0100	0011	0010	0001	0000
Optimum drive bias value	1/10	1/9.5	1/9	1/8	1/8	1/7	1/6	1/6	1/5	1/4
(BS2-0 set value)	000	001	010	011	011	100	101	101	110	111

#### **LCD Panel Interface**

The HD66740 has a function for changing the common driver/segment driver output shift direction using the CMS bit and SGS bit to meet the chip mounting positions of the HD66740. This is to facilitate the interface wiring to the LCD panel with COG or TCP installed.

Figure 29 1/80 Duty Drive Pattern Wiring

Figure 30 1-line Display Pattern Wiring

Table 22 Number of Left and Right Extension Lines of Common Driver

<b>Drive Duty Ratio</b>	Left Edge of Screen	Right Edge of Screen
1/48	16 (COM1-8, 41-48)	32 (COM9-40)
1/56	24 (COM1-8, 41-56)	32 (COM9-40)
1/64	32 (COM1-8, 41-64)	32 (COM9-40)
1/72	40 (COM1-8, 41-72)	32 (COM9-40)
1/80	40 (COM1-8, 41-72)	40 (COM9-40, 73-80)

# **Graphics Display Function**

In the graphics display mode, kanji characters, special symbols, and graphics icons can be displayed. Up to 112 x 80-dot display is allowed using the CGRAM. Thus, for a 12 x 13-dot kanji font, up to a 6-line x 9-character kanji display, and for a 14 x 15-dot kanji font, up to a 6-line x 8-character kanji display, and for a 16 x 16-dot kanji font, up to a 5-line x 6-character kanji display are allowed.

Figure 31 Display Example in Graphics Display Mode

# **Vertical Smooth Scroll Display**

The HD66740 can scroll character and graphics display vertically in units of raster-rows. This is achieved by writing display data into a one-line area that is not being used for display. In other words,

#### **HITACHI**

one line can be used to achieve continuous smooth vertical scroll even in a 9-line or less display. Here, after the 10th line is displayed, the first line is displayed again. When the 10th line is fully displayed, all one-line display data must be rewritten immediately after scrolling because there is no non-displayed area. Additionally, when display areas of a graphics icon such as a pictogram or a menu bar are partially fixed-displayed, the remaining areas can be displayed. For details, see the Partial Smooth Scroll Display Function section.

Specifically, this function is controlled by incrementing or decrementing the value in the display-start line bits (SL2 to SL0) and display-start raster-row bits (SN3 to SN0) by 1. For example, to smoothly scroll up, first set line bits SN3 to SN0 to 0000, and increment SL2 to SL0 by 1 from 000 to 111 to scroll seven raster-rows. Then increment line bits SN3 to SN0 to 0001, and again increment SL2 to SL0 by 1 from 000 to 111. If the vertical double-height display is at the top of the line, scrolling is done by each two raster-row.

When the response speed of the liquid crystal is low or when high-speed scrolling is needed, two-to four-raster-row scrolling is recommended.

# **Setting Instructions (10-line Display: NL3-0 = 1001)**

Figure 32 Setting Instructions for Vertical Smooth Scroll

# **Partial Smooth Scroll Display Function**

The HD66740 can partially fixed-display the areas of a graphics icon, such as a pictogram or a menu bar, and perform vertical smooth scrolling of the remaining bit-map areas. Since the PS1 to PS0 bits do not perform smooth scrolling of the upper first to third display lines but does fixed-display, pictograms can be placed. When CN1 to CN0 bits are set to 10, the first line is displayed at the bottom edge of the LCD screen, and the menu bar can be fixed-displayed at the bottom. This function can largely control the bit-map rewrite frequencies and reduce software loads.

Table 23 Bit Setting and Display Lines

Bit			C	N1-0 = 0	0		CN1-0 = 10

#### HITACHI

# **Double-height Display**

The HD66740 can double the height of any desired line from the first to 10th lines. A line can be selected by the DL1 to DL10 bits as listed in table 25. All graphics display patterns stored in the CGRAM can be doubled in height, allowing easy recognition. Note that there should be no space between the lines for double-height display (figure 36).

In vertical smooth scrolling, when the display-start setting line is displaying at double height, scrolling can be done by each two-line (dot).

Table 25 Double-height Display Specifications

Bit Setting	Display Position
DL1 = 1	1st line: double-height
DL2 = 1	2nd line: double-height
DL3 = 1	3rd line: double-height
DL4 = 1	4th line: double-height
DL5 = 1	5th line: double-height
DL6 = 1	6th line: double-height
DL7 = 1	7th line: double-height
DL8 = 1	8th line: double-height
DL9 = 1	9th line: double-height
DL10 = 1	10th line: double-height

Figure 36 Double-height Display (2nd and 8th Lines) **HITACHI** 

# **Reversed Display Function**

The HD66740 can display character/graphics display sections by black-and-white reversal. Black-and-white reversal can be easily displayed when REV is set to 1.

Figure 37 Reversed Display

# Partial-display-on Function

The HD66740 can program the liquid crystal display drive duty ratio setting (NL3-0 bits), liquid crystal display drive bias value selection (BS2-0 bits), boost output level selection (BT1/0 bit) and contrast adjustment (CT5-0 bits). For example, in the 10-line display mode (1/80 duty ratio), the HD66740 can selectively drive only the center of the screen or only the top or bottom of the screen by combining these register functions and the centering display (CN1-0 bit) function. This is called partial-display-on. Lowering the liquid crystal display drive duty ratio as required saves the liquid crystal display drive voltage, thus reducing internal current consumption. This is suitable for four-line display of a calendar or time, or the display of only graphics icons (pictograms) at the top or bottom of the screen, which needs to be continuous in the system standby state with minimal current consumption. Here, the non-displayed lines are constantly driven by the unselected level voltage, thus turning off the LCD for the lines.

In general, lowering the liquid crystal display drive duty ratio decreases the optimum liquid crystal display drive voltage and liquid crystal display drive bias value. This reduces output multiplying factors in the booster and greatly controls consumption current.

Table 26 Partial-display-on Function (10-line Display)

Item	Normal 10-line Display	Partial-on Display (Limited 4-line Display)		
LCD screen	10th line displayed	Only four lines on the center of the screen (from the 3rd to 6th lines)	Only four lines at the top and bottom of the screen (from the 1st to 3rd and 10th lines)	
LCD drive position shift	Not necessary (CN1-0 = 00)	Necessary (CN1-0 = 01)	Necessary (CN1-0 = 01)	
LCD drive duty ratio	1/80 (NL3-0 = 1001)	1/32 (NL3-0 = 0011)	1/32 (NL3-0 = 0011)	
LCD drive bias value (optimum)	1/10 (BS2-0 = 000)	1/6 (BS2-0 = 101)	1/6 (BS2-0 = 101)	
LCD drive voltage*	12 V to 15 V (adjustable using CT5–0)	6 V to 8 V (adjustable using CT5–0)	6 V to 8 V (adjustable using CT5–0)	
Boosting output multiplying factor	Five times (BT1-0 = 10)	Triple (BT1-0 = 00)	Triple (BT1-0 = 00)	
Frame frequency (fosc = 90 kHz)	70 Hz	88 Hz	88 Hz	

Note: The LCD drive voltage depends on the LCD materials which are actually used. Since the LCD drive voltage is high when the LCD drive duty ratio is high, a low duty ratio is suitable for low-power consumption.

Figure 38 Partial-on Display (Date and Time Indicated) (1)

Figure 39 Partial-on Display (Date and Time Indicated) (2)

# **Sleep Mode**

Setting the sleep mode bit (SLP) to 1 puts the HD66740 in the sleep mode, where the device stops all internal display operations, thus reducing current consumption. Specifically, LCD drive is completely halted. Here, all the SEG (SEG1 to SEG112) and COM (COM1 to COM80) pins output the GND level, resulting in no display. If the AMP bit is set to 0 in the sleep mode, the LCD drive power supply can be turned off, reducing the total current consumption of the LCD module.

Table 27 Comparison of Sleep Mode and Standby Mode

Function	Sleep Mode (SLP = 1)	Standby Mode (STB = 1)
LCD control	Turned off	Turned off
R-C oscillation circuit	Operates normally	Halted

# **Standby Mode**

Setting the standby mode bit (STB) to 1 puts the HD66740 in the standby mode, where the device stops completely, halting all internal operations including the R-C oscillation circuit, thus further reducing current consumption compared to that in the sleep mode. Specifically, character and segment displays, which are controlled by the multiplexing drive method, are completely halted. Here, all the SEG (SEG1 to SEG112) and COM (COM1 to COM80) pins output the GND level, resulting in no display. If the AMP bit is set to 0 in the standby mode, the LCD drive power supply can be turned off.

During the standby mode, no instructions can be accepted other than the start-oscillation. To cancel the standby mode, issue the start-oscillation instruction to stabilize R-C oscillation before setting the STB bit to 0

Figure 40 Procedure for Setting and Canceling Standby Mode

# **Absolute Maximum Ratings**

Item	Symbol	Unit	Value	Notes*
Power supply voltage (1)	V <sub>cc</sub>	V	-0.3 to +4.6	1, 2
Power supply voltage (2)	$V_{\tiny LCD}$ – GND	V	-0.3 to +16.0	1, 3
Input voltage	Vt	V	$-0.3$ to $V_{cc} + 0.3$	1
Operating temperature	Topr	°C	-40 to +85	1, 4
Storage temperature	Tstg	°C	-55 to +110	1, 5

Notes: 1. If the LSI is used above these absolute maximum ratings, it may become permanently damaged. Using the LSI within the following electrical characteristics limits is strongly recommended for normal operation. If these electrical characteristic conditions are also exceeded, the LSI will malfunction and cause poor reliability.

- 2. VCC > GND must be maintained.
- 3. VLCD > GND must be maintained.
- 4. For bare die and wafer products, specified up to 85°C.
- 5. This temperature specifications apply to the TCP package.

### **Booster Characteristics**

Item	Symbol	Min	Тур	Max	Unit	Test Condition	Notes
Triple-boost output voltage (VLOUT pin)	V <sub>UP3</sub>	8.5	8.9	9.0	V	$V_{cc} = Vci = 3.0 \text{ V},$ $I_{o} = 30  \mu\text{A}, \text{ C} = 1  \mu\text{F},$ $f_{osc} = 86 \text{ kHz}, \text{ Ta} = 25^{\circ}\text{C}$	12
Quadruple- boost output voltage (VLOUT pin)	V <sub>UP4</sub>	11.5	11.8	12.0	V	$\begin{split} &V_{\text{CC}} = \text{Vci} = 3.0 \text{ V}, \\ &I_{\text{O}} = 30  \mu\text{A}, \text{ C} = 1  \mu\text{F}, \\ &f_{\text{OSC}} = 86 \text{ kHz}, \text{Ta} = 25^{\circ}\text{C} \end{split}$	12
Five-times- boost output voltage (VLOUT pin)	V <sub>UP5</sub>	14.5	14.8	15.0	V	$V_{cc} = Vci = 3.0 \text{ V},$ $I_{o} = 30  \mu\text{A}, \text{ C} = 1  \mu\text{F},$ $f_{osc} = 86 \text{ kHz}, \text{ Ta} = 25^{\circ}\text{C}$	12
Use range of boost output voltage	$V_{UP3}, \ V_{UP4}, \ V_{UP5}$	V <sub>cc</sub>	_	15.0	V	For triple to Five-times boost	12

Note: For the numbered notes, refer to the Electrical Characteristics Notes section following these tables

# AC Characteristics (V $_{\rm CC}$ = 1.8 to 3.6 V, Ta = –40 to +85 $^{\circ}C^{*1})$

# Clock Characteristics (V $_{\text{CC}}$ = 1.8 to 3.6 V)

Item	Symbol	Min	Тур	Max	Unit	<b>Test Condition</b>	Notes
External clock frequency	fcp	50	75	100	kHz		10
External clock duty ratio	Duty	45	50	55	%		10
External clock rise time	trcp	_	<u> </u>	0.2	μs		10
External clock fall time	tfcp	_		0.2	μs		10
R-C oscillation clock	f <sub>osc</sub>	69	86	103	kHz	Rf = 270 kΩ, $V_{cc}$ = 3 V	11

Note: For the numbered notes, refer to the Electrical Characteristics Notes section following these tables.

### **Electrical Characteristics Notes**

- 1. For bare die products, specified up to 85°C.
- 2. The following three circuits are I/O pin configurations (figure 41).

Figure 41 I/O Pin Configuration

### **HITACHI**

- The TEST pin must be grounded and the IM2/1, IM0/ID, and OPOFF pins must be grounded or connected to Vcc.
- 4. Corresponds to the high output for clock-synchronized serial interface.
- 5. Applies to the resistor value (RCOM) between power supply pins V1OUT, V2OUT, V5OUT, GND and common signal pins, and resistor value (RSEG) between power supply pins V1OUT, V3OUT, V4OUT, GND and segment signal pins, when current Id is flown through all driver output pins.
- 6. This excludes the current flowing through pull-up MOSs and output drive MOSs.
- 7. This excludes the current flowing through the input/output units. The input level must be fixed high or low because through current increases if the CMOS input is left floating.
- 8. The following shows the relationship between the operation frequency (fosc) and current consumption (Icc) (figure 42).

Figure 42 Relationship between the Operation Frequency and Current Consumption

- 9. Each COM and SEG output voltage is within  $\pm 0.15$  V of the LCD voltage (Vcc, V1, V2, V3, V4, V5) when there is no load.
- 10. Applies to the external clock input (figure 43).

Figure 43 External Clock Supply

11. Applies to the internal oscillator operations using external oscillation resistor Rf (figure 44 and table 28).

Figure 44 Internal Oscillation

Table 28 External Resistance Value and R-C Oscillation Frequency (Referential Data)

External	R-C Oscillati	R-C Oscillation Frequency: fosc									
Resistance (Rf)	Vcc = 1.8 V	Vcc = 2.2 V	Vcc = 3.0 V	Vcc = 3.6 V							
200 kΩ	89 kHz	103kHz	115 kHz	121 kHz							
270 kΩ	70 kHz	80 kHz	88 kHz	92 kHz							
300 kΩ	65 kHz	73 kHz	80 kHz	83 kHz							
330 kΩ	60 kHz	68 kHz	74 kHz	77 kHz							
360 kΩ	55 kHz	62 kHz	68 kHz	71 kHz							
390 kΩ	52 kHz	58 kHz	64 kHz	66 kHz							
430 kΩ	48 kHz	53 kHz	58 kHz	60 kHz							
470 kΩ	44 kHz	48 kHz	52 kHz	54 kHz

### Power-on/off Sequence

To prevent pulse lighting of LCD screens at power-on/off, the power-on/off sequence is activated as shown below. However, since the sequence depends on LCD materials to be used, confirm the conditions by using your own system.

### **Power-on Sequence**

Figure 52 Power-on Sequence

Figure 53 Power-on Timing

### **Power-off Sequence**

Figure 55 Power-off Timing

#### Modification history

### Revision 0.1 (Feb. 15. 2000)

First release

### Revision 0.2 (5. May. 2000)

- Change pad pitch from 60um to 50um.
- Added LCD-Driving-Pattern Control instruction

### Revision 0.3 (1. July. 2000)

- Added pad arrangement figure and coordinate table
- Change figure 41 (remove pull-up MOS from DB7 to DB0)

#### Revision 0.4 (September. 2000)

- Added RS pin explanation when serial interface mode is used.
- Added standard TCP (TB0) drawing.

#### Revision 0.5 (November. 2000)

- Remove cursor display related explanations.
- Remove character and super-imposed display related explanations.

### Revision 0.6 (January. 2001)

- Support 1.8V low voltage operation.
- Corrected corner PAD number (p6).
- Added VTEST usage (p48) and operational amplifier usage (p49).
- Changed R-C Oscillation Frequency of Table 28 (p83).
- Added I2C interface (HCD66740WBP, HD66740WTB0).

#### Revision 0.7 (January. 2001)

- Added power on/off sequence.

When using this document, keep the following in mind:

- 1. This document may, wholly or partially, be subject to change without notice.
