- 2/ All outputs must be tested. In the case where only one input at V_{VIL} maximum or V_{VIH} minimum produces the proper output state, the test must be performed with each input being selected as the V_{VIL} maximum or V_{VIH} minimum input.
- 3/ The output conditions have been chosen to produce a current that closely approximates one half of the true short circuit output current, I_{O5}. Not more than one output will be tested at one time and the duration of the test condition shall not exceed one second.
- 4/ Propagation delay limits are based on single output switching. Unused outputs = 3.5 V or < 0.3 V.
