**HARRIS****HA-5102/04/12/14**

Low Noise High Performance Operational Amplifiers

August 1991

Features

- Low Noise $4.3\text{nV}/\sqrt{\text{Hz}}$
- Wide Bandwidth 8MHz (Compensated)
60MHz (Uncompensated)
- High Slew Rate $3\text{V}/\mu\text{s}$ (Compensated)
 $20\text{V}/\mu\text{s}$ (Uncompensated)
- Low Offset Voltage 0.5mV
- Available in Duals or Quads

Description

Low noise and high performance are key words describing HA-5102/04/12/14. These general purpose amplifiers offer an array of dynamic specifications ranging from a $3\text{V}/\mu\text{s}$ slew rate and 8MHz bandwidth (5102/04) to $20\text{V}/\mu\text{s}$ slew rate and 60MHz gain-bandwidth-product (HA-5112/14). Complementing these outstanding parameters is a very low noise specification of $4.3\text{nV}/\sqrt{\text{Hz}}$ at 1kHz.

Fabricated using the Harris high frequency DI process, these operational amplifiers also offer excellent input specifications such as a 0.5mV offset voltage and 30nA offset current. Complementing these specifications are 108dB open loop gain and 108dB channel separation. Consuming a very modest amount of power (90mW/package for duals and 150mW/package for quads), HA-5102/04/12/14 also provide 15mA of output current.

Applications

- High Q, Active Filters
- Audio Amplifiers
- Instrumentation Amplifiers
- Integrators
- Signal Generators
- For Further Design Ideas, See App. Note 554.

This impressive combination of features make this series of amplifiers ideally suited for designs ranging from audio amplifiers and active filters to the most demanding signal conditioning and instrumentation circuits.

These operational amplifiers are available in dual or quad form with industry standard pinouts allowing for immediate inter-changeability with most other dual and quad operational amplifiers.

HA-5102 Dual, Comp. HA-5104 Quad, Comp.
HA-5112 Dual, Uncomp. HA-5114 Quad, Uncomp.

Each of these products are available in -2 (-55°C to +125°C), -5 (0°C to +75°C), -9 (-40°C to +85°C) or /883 grades. Refer to the /883 data sheet for military product.

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. For supply voltages $< 15V$, the absolute maximum input voltage is equal to the supply voltage.
3. Any one amplifier may be shorted to ground indefinitely.
4. Derate 9.6mW/°C above $T_A = +25^\circ\text{C}$.
5. $V_{OUT} = \pm 10V$, $R_L = 2K$
6. $V_{CM} = \pm 5.0V$
7. Channel separation value is referred to the input of the amplifier. Input test conditions are: $f = 10\text{kHz}$; $V_{IN} = 200\text{mV}$ peak to peak; $R_S = 1k\Omega$. (Refer to Channel Separation vs. Frequency Curve for test circuits.)

8. Output current is measured with $V_{OUT} = \pm 5V$.

9. Full power bandwidth is guaranteed by equation:

$$\text{Full power bandwidth} = \frac{\text{Slew Rate}}{2\pi V_{\text{peak}}}$$

10. Refer to Test Circuits section of the data sheet.

11. Settling time is measured to 0.1% of final value for a 1 volt input step, and $A_V = -10$ for HA-5112/5114, and a 10 volt input step, $A_V = -1$ for HA-5102/5104.

12. Sample tested.
