

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## DESCRIPTION

The MH1S72CPG is 1048576-word by 64-bit Synchronous DRAM module. This consists of five industry standard 1Mx16 Synchronous DRAMs in TSOP and one industry standard EEPROM in TSSOP.

The mounting of TSOP on a card edge Dual Inline package provides any application where high densities and large quantities of memory are required.

This is a socket type - memory modules, suitable for easy interchange or addition of modules.

## FEATURES

	Frequency	CLK Access Time (Component SDRAM)
-10	100MHz	8ns(CL=3)
-12	83MHz	8ns (CL=3)
-15	67MHz	9ns (CL=3)

- Utilizes industry standard 1M x 16 Synchronous DRAMs TSOP and industry standard EEPROM in TSSOP
- 168-pin (84-pin dual in-line package)
- single 3.3V±0.3V power supply
- Clock frequency 100MHz/83MHz/67MHz
- Fully synchronous operation referenced to clock rising edge
- Dual bank operation controlled by BA(Bank Address)
- /CAS latency- 1/2/3(programmable)
- Burst length- 1/2/4/8(programmable)
- Burst type- sequential / interleave(programmable)
- Column access - random
- Auto precharge / All bank precharge controlled by A10
- Auto refresh and Self refresh
- 4096 refresh cycle /64ms
- LVTTTL Interface

## APPLICATION

main memory or graphic memory in computer systems

Module item "-10", "-12", and "-15" show mounted SDRAM devices Cycle time(min.).

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

**PIN FUNCTION**

CK (CK0)	Input	Master Clock:All other inputs are referenced to the rising edge of CK
CKE	Input	Clock Enable:CKE controls internal clock.When CKE is low,internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE E becomes asynchronous input.Self refresh is maintained as long as CKE is low.
/S (/S0 &/S2)	Input	Chip Select: When /S is high,any command means No Operation.
/RAS,/CAS,/WE	Input	Combination of /RAS,/CAS,/WE defines basic commands.
A0-10	Input	A0-10 specify the Row/Column Address in conjunction with BA.The Row Address is specified by A0-10.The Column Address is specified by A0-7.A10 is also used to indicate precharge option.When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, both banks are precharged.
BA	Input	Bank Address:BA is not simply BA.BA specifies the bank to which a command is applied.BA must be set with ACT,PRE,READ,WRITE commands
DQ0-63	Input/Output	Data in and Data out are referenced to the rising edge of CK
CB0-7	Input/Output	Check bit in and Check bit out are referenced to the rising edge of CK
DQMB0-7	Input	Din Mask/Output Disable:When DQMB is high in burst write.Din for the current cycle is masked.When DQMB is high in burst read,Dout is disabled at the next but one cycle.
Vdd,Vss	Power Supply	Power Supply for the memory mounted module.
SLA	Input	Serial clock for serial PD
SDA	Output	Serial data for serial PD

## BASIC FUNCTIONS

The MH1S72CPG provides basic functions, bank(row) activate, burst read / write, bank(row) precharge, and auto / self refresh.

Each command is defined by control signals of /RAS, /CAS and /WE at CK rising edge. In addition to 3 signals, /S, CKE and A10 are used as chip select, refresh option, and precharge option, respectively.

To know the detailed definition of commands please see the command truth table.

### Activate(ACT) [/RAS =L, /CAS = /WE =H]

ACT command activates a row in an idle bank indicated by BA.

### Read(READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read(auto-precharge, **READA**).

### Write(WRITE) [/RAS =H, /CAS = /WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write(auto-precharge, **WRITEA**).

### Precharge(PRE) [/RAS =L, /CAS =H, /WE =L]

PRE command deactivates the active bank indicated by BA. This command also terminates burst read / write operation. When A10 =H at this command, both banks are deactivated(precharge all, **PREA**).

### Auto-Refresh(PEFA) [/RAS =/CAS =L, /WE =CKE =H]

PEFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

**ABBREVIATIONS:**

H = High Level, L = Low Level, X = Don't Care

BA = Bank Address, RA = Row Address, CA = Column Address, NOP = No Operation

**NOTES:**

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and / or data-integrity are not guaranteed.

	H	L	X	X	X	X	X	Begin CK0 Suspend at Next Cycle*3
	L	H	X	X	X	X	X	Exit CK0 Suspend at Next Cycle*3
	L	L	X	X	X	X	X	Maintain CK0 Suspend

## ABBREVIATIONS:

H = High Level, L = Low Level, X = Don't Care

## NOTES:

1. CKE Low to High transition will re-enable CK and other inputs **asynchronously**.  
A minimum setup time must be satisfied before any command other than EXIT.
2. Power-Down and Self-Refresh can be entered only from the All banks idle State.
3. Must be legal command.

## POWER ON SEQUENCE

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or malfunctioning.

1. Apply power and start clock. Attempt to maintain CKE high, DQMB0-7 high and NOP condition at the inputs.
2. Maintain stable power, stable clock, and NOP input conditions for a minimum of 500É s.
3. Issue precharge commands for all banks. (PRE or PREA)
4. After all banks become idle state (after tRP), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.

After these sequence, the SDRAM is idle state and ready for normal operation.

## MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register(MRS). The mode register stores these data until the next MRS command, which may be issue when both banks are in idle state. After tRSC from a MRS command, the SDRAM is ready for new command.

R:Reserved for Future Use

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## OPERATION DESCRIPTION

### BANK ACTIVATE

The SDRAM has two independent banks. Each bank is activated by the ACT command with the bank address(BA). A row is indicated by the row address A10-0. The minimum activation interval between one bank and the other bank is tRRD.

### PRECHARGE

The PRE command deactivates indicated by BA. When both banks are active, the precharge all command(PREA, PRE + A10=H) is available to deactivate them at the same time. After tRP from the precharge, an ACT command can be issued.

### READ

After tRCD from the bank activation, a READ command can be issued. 1st output date is available after the /CAS Latency from the READ, followed by (BL-1) consecutive date when the Burst Length is BL. The start address is specified by A7-0, and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time(tRP) can be hidden behind continuous output data(in case of BL=8) by interleaving the dual banks. When A10 is high at a READ command, the auto-precharge(READA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge start timing depends on /CAD Latency. The next ACT command can be issued after tRP from the internal precharge timing.

## READ Auto-Precharge Timing (BL=4)

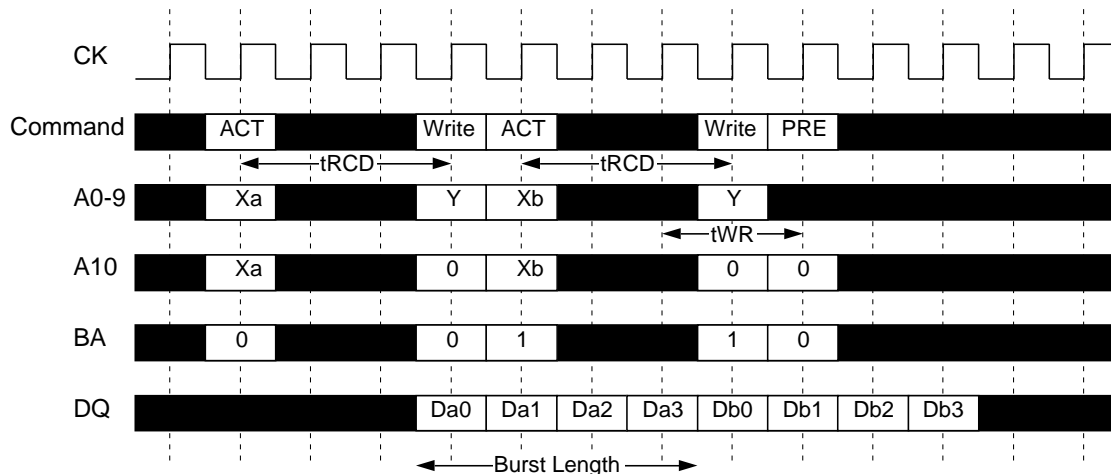

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

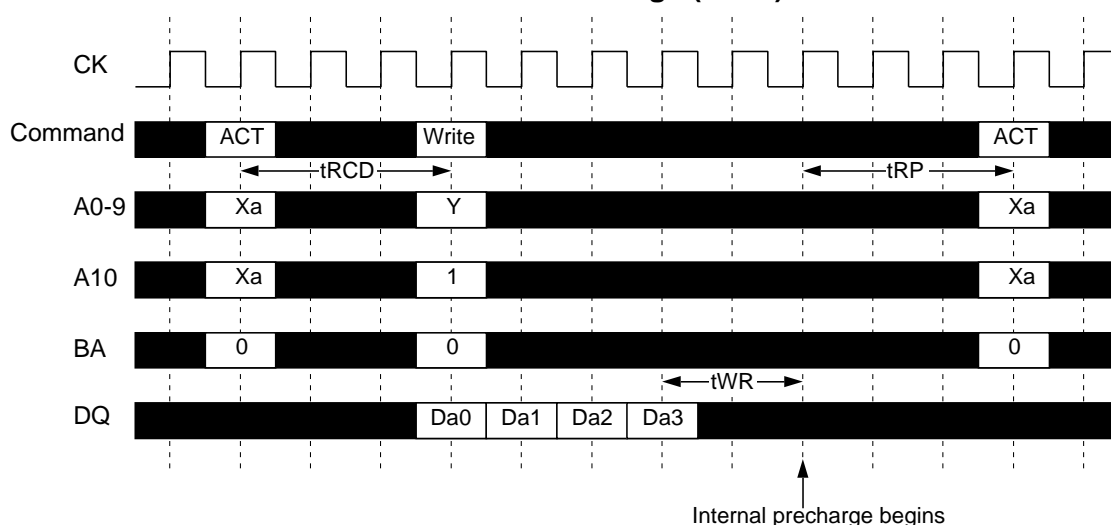

## WRITE

After  $t_{RCD}$  from the bank activation, a WRITE command can be issued. 1st input data is set at the same cycle as the WRITE. Following(BL-1) data are written into the RAM, when the Burst Length is BL. The start address is specified by A7-0, and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time( $t_{RP}$ ) can be hidden behind continuous input data (in case of BL=4) by interleaving the dual banks. From the last input data to the PRE command, the write recovery time ( $t_{WR}$ ) is required. When A10 is high at a WRITE command, the auto-precharge(WRITEA) is performed. Any command(READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge begins at  $t_{WR}$  after the last input data cycle. The next ACT command can be issued after  $t_{RP}$  from the internal precharge timing.

### Dual Bank Interleaving WRITE (BL=4)

### WRITE with Auto-Precharge (BL=4)

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

## BURST INTERRUPTION

### [ Read Interrupted by Read ]

Burst read option can be interrupted by new read of the same or the other bank.  
MH1S72CPG allows random column access. READ to READ interval is minimum 1 CK

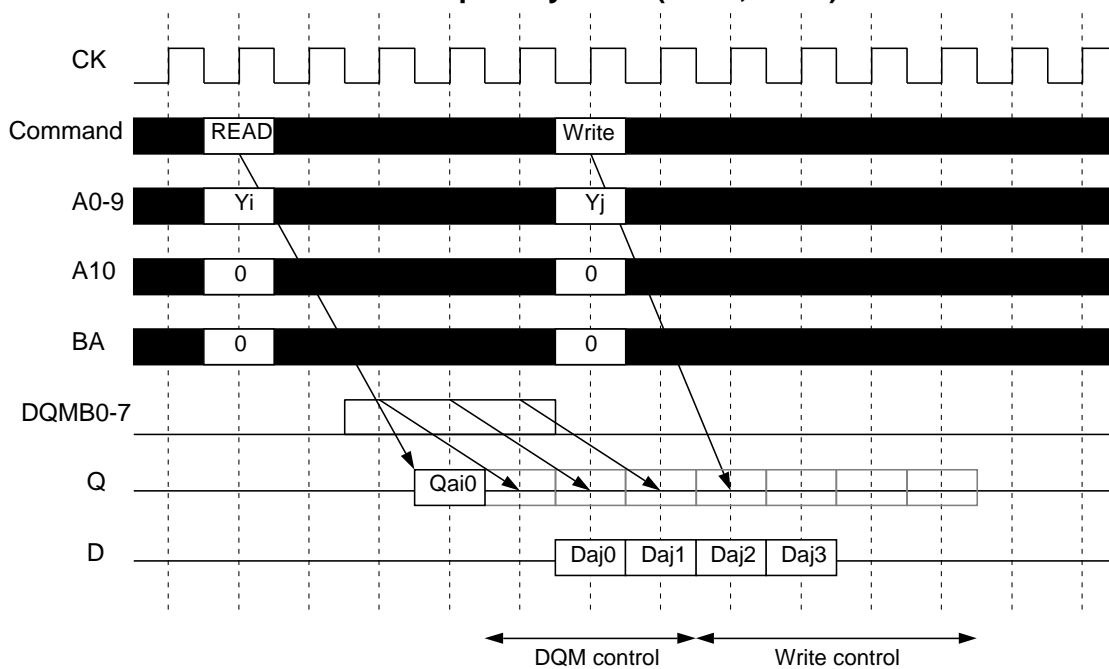

**Read Interrupted by Read (BL=4, CL=3)**

### [ Read Interrupted by Write ]

Burst read operation can be interrupted by write of the same or the other bank. Random column access is allowed. In this case, the DQ should be controlled adequately by using the DQMB0-7 to prevent the bus contention. The output is disabled automatically 2 cycle after WRITE assertion.

**Read Interrupted by Write (BL=4, CL=3)**

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## [ Read Interrupted by Precharge ]

Burst read operation can be interrupted by precharge of the same or the other bank. Read to PRE interval is minimum 1 CK. A PRE command disables the data output, depending on the /CAS Latency. The figure below shows examples, when the dataout is terminated.

### Read Interrupted by Precharge (BL=4)

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

## [ Read Interrupted by Burst Terminate ]

Similarly to the precharge, burst terminate command can interrupt burst read operation and disable the data output. READ to TERM interval is minimum 1 CK. The figure below shows examples, when the dataout is terminated.

Read Interrupted by Burst Terminate (BL=4)

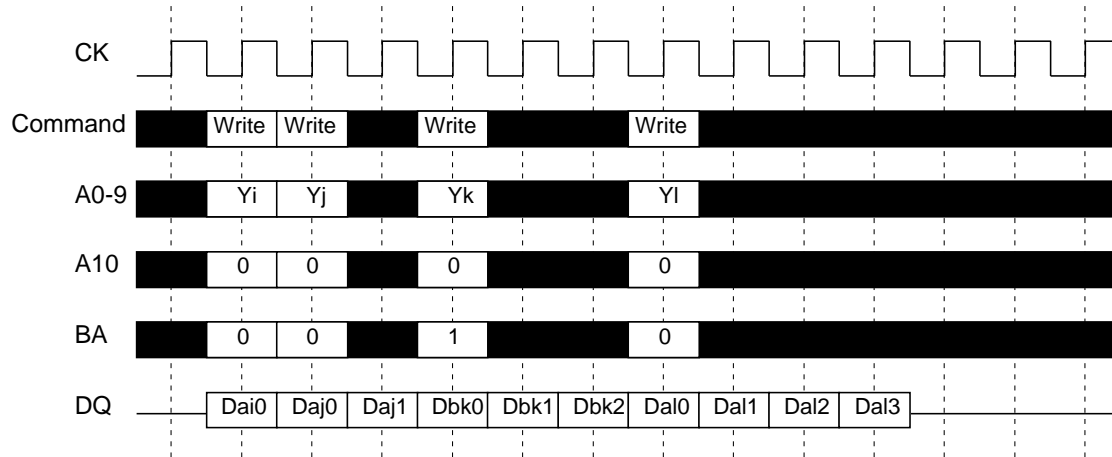

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

## [ Write Interrupted by Write ]

Burst write operation can be interrupted by new write of the same or the other bank.  
Random column access is allowed. WRITE to WRITE interval is minimum 1 CK.

**Write Interrupted by Write (BL=4)**

## [ Write Interrupted by Read ]

Burst write operation can be interrupted by read of the same or the other bank.  
Random column access is allowed. WRITE to READ interval is minimum 1 CK. The input data on DQ at the interrupting READ cycle is "don't care".

**Write Interrupted by Read (BL=4, CL=3)**

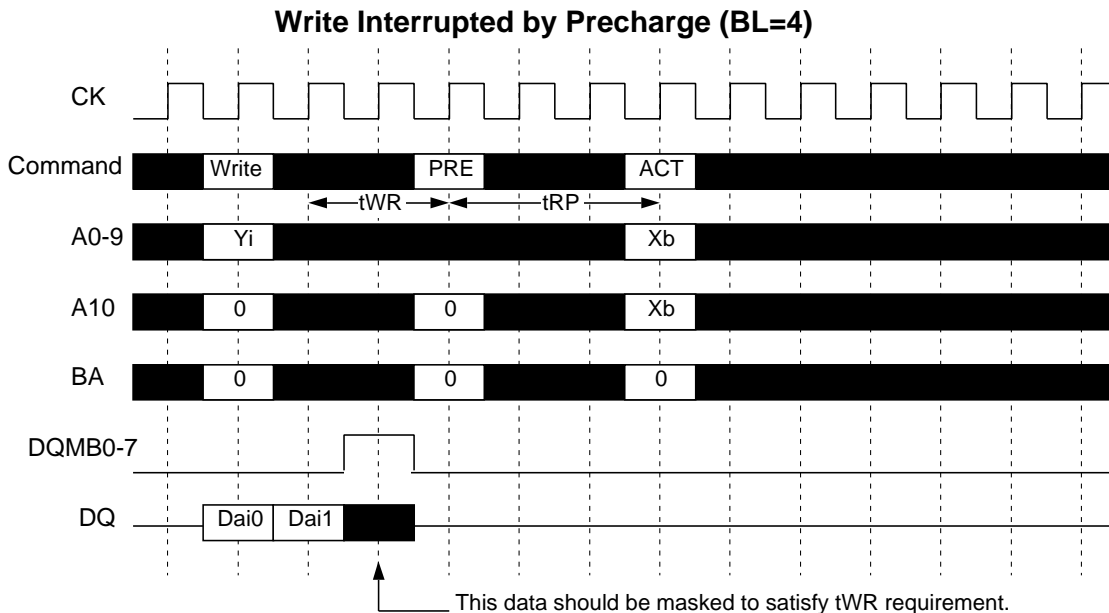

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

## [ Write Interrupted by Precharge ]

Burst write operation can be interrupted by precharge of the same bank. Random column access is allowed. Because the write recovery time( $t_{WR}$ ) is required between the last input data and the next PRE, 3rd data should be masked with DQMB0-7 shown as below.

## [ Write Interrupted by Burst Terminate ]

Burst terminate command can terminate burst write operation. In this case, the write recovery time is not required and the bank remains active. The figure below shows the case 3 words of data are written. Random column access is allowed. WRITE to TERM interval is minimum 1 CK.

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## AUTO REFRESH

Single cycle of auto-refresh is initiated with a REFA(/CS=/RAS=/CAS=L, /WE=/CKE=H) command. The refresh address is generated internally. 4096 REFA cycle within 64ms refresh 16Mbit memory cells. The auto-refresh is performed on each bank alternately (ping-pong refresh). Before performing an auto-refresh, both banks must be in the idle state. Additional commands must not be supplied to the device before tRC from the REFA command.

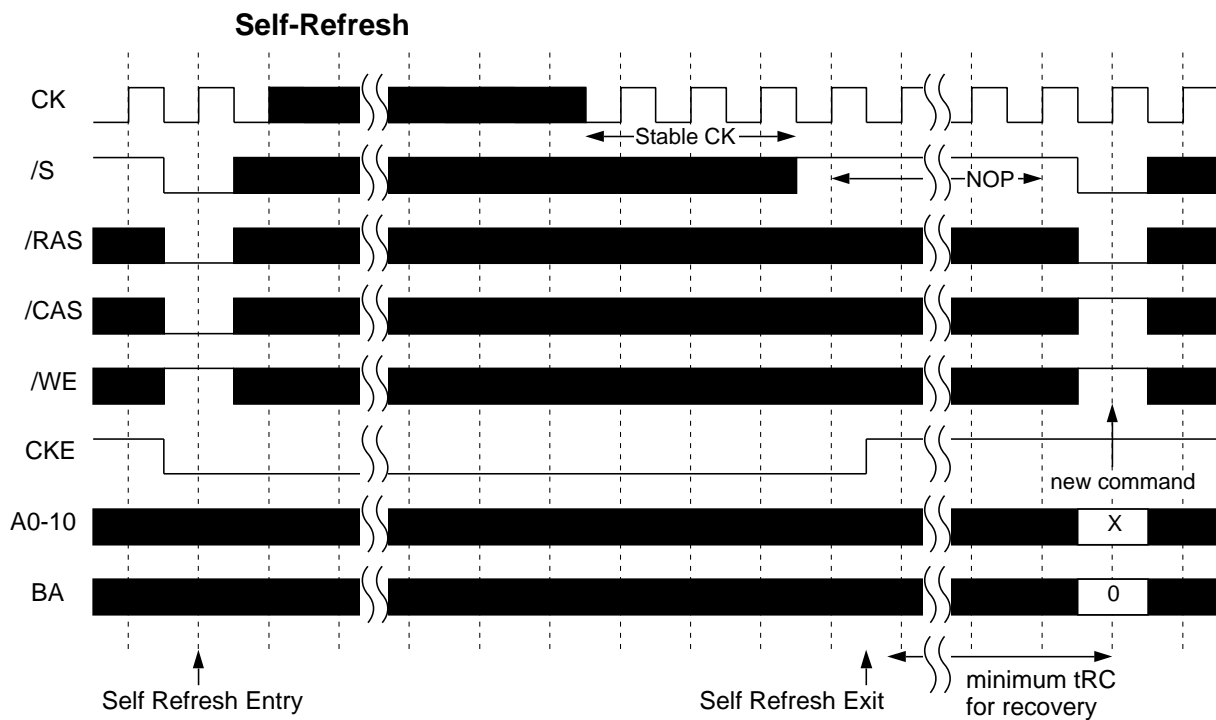

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT)SynchronousDRAM

## SELF REFRESH

Self-refresh mode is entered by issuing a REFS command ( $/CS=/RAS=/CAS=L$ ,  $/WE=H$ ,  $CKE=L$ ). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enabled input (but asynchronous), all other inputs including CK0 are disabled and ignored, and power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CK0 inputs, asserting DESEL or NOP command and then asserting CKE(REFSX). After tRC from REF SX both banks are in the idle state and a new command can be issued after tRC, but DESEL or NOP commands must be asserted till then.

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## CLK SUSPEND

CKE controls the internal CLK at the following cycle. Figure below shows how CKE works. By negating CKE, the next internal CLK is suspended. The purpose of CLK suspend is power down, output suspend or input suspend. CKE is a synchronous input except during the self-refresh mode. CLK suspend can be performed either when the banks are active or idle, but a command at the following cycle is ignored.

### Power Down by CKE

### DQ Suspend by CKE

# MH1S72CPG-10,-12,-15

75497472-BIT (1048576-WORD BY 72-BIT) Synchronous DRAM

## DQM CONTROL

DQMB0-7 is a dual function signal defined as the data mask for writes and the output disable for reads. During writes, DQMB0-7 masks input data word by word. DQMB0-7 to write mask latency is 0.

During reads, DQMB0-7 forces output to Hi-Z word by word. DQMB0-7 to output Hi-Z latency is 2.
