HM62V16102I Series

Wide Temperature Range Version
16 M SRAM (1-Mword × 16-bit)

HITACHI

Description

The Hitachi HM62V16102I Series is 16-Mbit static RAM organized 1-Mword × 16-bit. HM62V16102I Series has realized higher density, higher performance and low power consumption by employing Hi-CMOS process technology. It offers low power standby power dissipation; therefore, it is suitable for battery backup systems. It is packaged in 48 bumps chip size package with 0.75 mm bump pitch for high density surface mounting.

Features

- Single 2.5 V and 3.0 V supply: 2.2 V to 3.6 V
- Fast access time: 25/35 ns (max)
- Page access time: 15/20 ns (max)
- Power dissipation:
  — Active: TBD (typ)
  — Standby: 1.5 μW (typ)
- Completely static memory.
  — No clock or timing strobe required
- Equal access and cycle times
- Common data input and output.
  — Three state output
- Battery backup operation.
  — 2 chip selection for battery backup
- Temperature range: –40 to +85°C

Notes: 1. t_{CHZ}, t_{OHZ}, t_{WHZ} and t_{BHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.

2. This parameter is sampled and not 100% tested.

3. At any given temperature and voltage condition, t_{HZ} max is less than t_{LZ} min both for a given device and from device to device.

4. A write occures during the overlap of a low $\overline{CS1}$, a high CS2, a low $\overline{WE}$ and a low $\overline{LB}$ or a low $\overline{UB}$. A write begins at the latest transition among $\overline{CS1}$ going low, CS2 going high, $\overline{WE}$ going low and $\overline{LB}$ going low or $\overline{UB}$ going low. A write ends at the earliest transition among $\overline{CS1}$ going high, CS2 going low, $\overline{WE}$ going high and $\overline{LB}$ going high or $\overline{UB}$ going high. t_{WP} is measured from the beginning of write to the end of write.

5. t_{CW} is measured from the later of $\overline{CS1}$ going low or CS2 going high to the end of write.

6. t_{AS} is measured from the address valid to the beginning of write.

7. t_{WR} is measured from the earliest of $\overline{CS1}$ or $\overline{WE}$ going high or CS2 going low to the end of write cycle.

Notes: 1. This characteristic is guaranteed only for L-version.

2. This characteristic is guaranteed only for L-SL version.

3. CS2 controls address buffer, $\overline{WE}$ buffer, $\overline{CS1}$ buffer, $\overline{OE}$ buffer, $\overline{LB}$, $\overline{UB}$ buffer and Din buffer. If CS2 controls data retention mode, Vin levels (address, $\overline{WE}$, $\overline{OE}$, $\overline{CS1}$, $\overline{LB}$, $\overline{UB}$, I/O) can be in the high impedance state. If $\overline{CS1}$ controls data retention mode, CS2 must be $CS2 \geq V_{CC} - 0.2\ V$ or $0\ V \leq CS2 \leq 0.2\ V$. The other input levels (address, $\overline{WE}$, $\overline{OE}$, $\overline{LB}$, $\overline{UB}$, I/O) can be in the high impedance state.

4. Typical values are at $V_{CC} = 1.5\ V$, Ta = +25°C and not guaranteed.

5. t_{RC} = read cycle time.
