

MCM60L256A-V

Advance Information

32K x 8 Bit CMOS Static Random Access Memory

Extended Temperature Range: -40 to 105°C

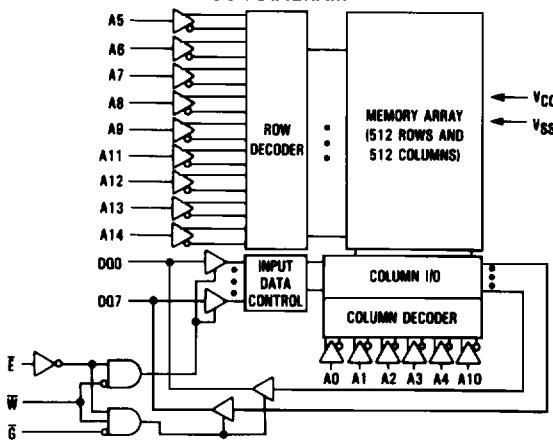

The MCM60L256A-V is a 262,144 bit low-power static random access memory organized as 32,768 words of 8 bits, fabricated using silicon-gate CMOS technology. Static design eliminates the need for external clocks or timing strobes, while CMOS circuitry reduces power consumption and provides greater reliability. The operating current is 5 mA/MHz (typ) and the cycle time is 100 ns. For long cycle times (>100 ns), the automatic power down (APD) circuitry will temporarily shut down various power consuming circuits, thereby reducing the active power consumption.

Chip enable (\bar{E}) controls the power-down feature. It is not a clock but rather a chip control that affects power consumption. When \bar{E} is a logic high, the part is placed in low power standby mode. The maximum standby current is 2 μ A ($T_A = 25^\circ\text{C}$). Chip enable also controls the data retention mode. Another control feature, output enable (\bar{G}) allows access to the memory contents as fast as 50 ns. Thus the MCM60L256A-V is suitable for use in various microprocessor application systems where high speed, low power, and battery backup are required.

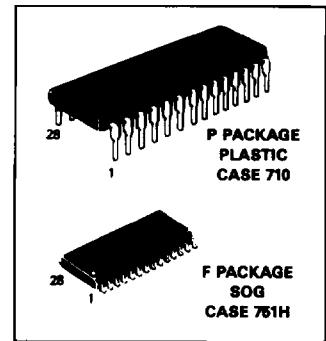

The MCM60L256A-V is offered in a 28 pin, 600 mil plastic dual-in-line package and a 330 mil gull-wing SO package.

- Single 5 V Supply, $\pm 10\%$
- 32K x 8 Organization
- Fully Static — No Clock or Timing Strobes Necessary
- Low Power Dissipation—27.5 mW/MHz (Typical Active)
- Output Enable and Chip Enable Inputs for More System Design Flexibility and Low Power Standby Mode
- Battery Backup Capability (Maximum Standby Current = 2 μ A @ 25°C)
- Data Retention Supply Voltage = 2.0 V to 5.5 V
- All Inputs and Outputs Are TTL Compatible
- Three State Outputs
- Fast Access Time: MCM60L256A-V10 = 100 ns (Max)

Output Enable to Output High-Z	t _{GHZ}	t _{OHZ}	0	35	ns	2, 3

NOTES:

1. W is high at all times for read cycles.
2. All high-Z and low-Z parameters are considered in a high or low impedance state when the output has made a 100 mV transition from the previous steady state voltage.
3. These parameters are periodically sampled and not 100% tested.

Write Recovery Time	t_{WHAX}/t_{EHAX}	t_{WR}	0	—	ns	5
Chip Enable to End of Write	t_{ELWH}/t_{ELEH}	t_{CW}	80	—	ns	—

NOTES:

1. Outputs are in high impedance state if \bar{G} is high during Write Cycle.
2. A write occurs during the overlap (t_{typ}) of a low E and a low W . If W goes low prior to E low then outputs will remain in a high impedance state.
3. All high-Z and low-Z parameters are considered in a high or low impedance state when the outputs have made a 100 mV transition from the previous steady state voltage.
4. These parameters are periodically sampled and not 100% tested.
5. t_{WR} is measured from the earlier of E or W going high to the end of write cycle.
