

West Bridge[®]: Astoria[™] USB and Mass Storage Peripheral Controller

Features

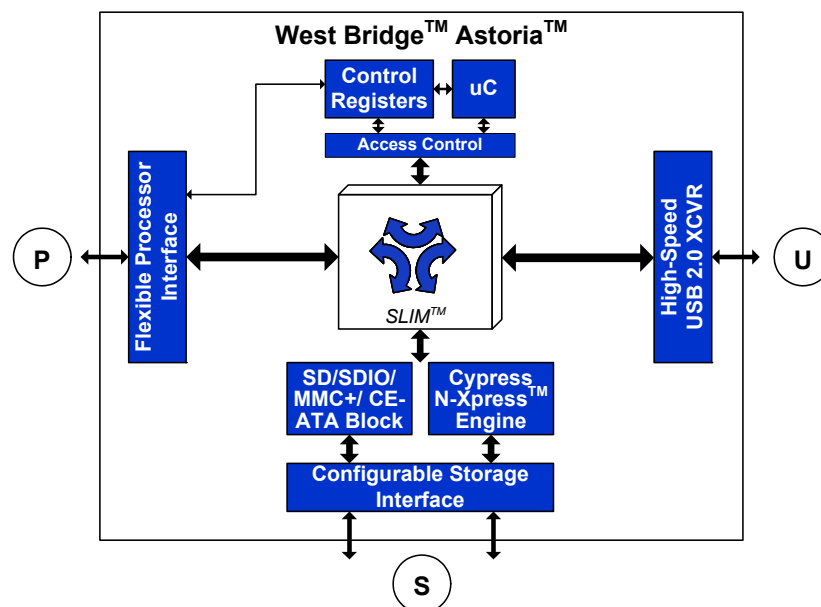

- Multimedia device support
 - Up to two SD, SDIO, MMC, MMC+, and CE-ATA devices
- Supports Microsoft[®] Media Transfer Protocol (MTP) with optimized data throughput
- Simultaneous Link to Independent Multimedia (SLIM[®]) architecture, enabling simultaneous and independent data paths between the processor and USB, and between the USB and mass storage
- High-speed USB at 480 Mbps
 - USB 2.0 compliant
 - Integrated USB switch
 - Integrated USB 2.0 transceiver, smart serial interface engine
 - 16 programmable endpoints
- GPIF (General Programmable Interface)
 - Allows direct connection to most parallel interface
 - Programmable waveform descriptors and configuration registers to define waveforms
 - Supports multiple Ready (RDY) inputs and Control (CTL) outputs
- Flexible processor interface that supports:
 - Multiplexing and nonmultiplexing address and data interface
 - SRAM interface
 - Pseudo cellular random access memory (CRAM) interface (Antioch interface)
 - Pseudo NAND flash interface

- SPI (slave mode) interface
- Direct memory access (DMA) slave support
- FlexBoot
 - Processor can boot from the processor interface port
- Ultra low power, 1.8-V core operation
- Low power modes
- Small footprint:
 - 3.91 × 3.91 × 0.55 mm 81-ball WLCSP (SP and Lite SP)
 - 6 × 6 × 1.0 mm 100-ball VFBGA
 - 10 × 10 × 1.20 mm 121-ball FBGA
- Supports I²C boot and processor boot
- Selectable clock input frequencies
 - 19.2 MHz, 24 MHz, 26 MHz, and 48 MHz

Applications

- Cellular phones
- Portable media players
- Personal digital assistants
- Portable navigation devices
- Digital cameras
- POS terminals
- Portable video recorders
- Data cards and wireless dongles

Functional Overview

Turbo-MTP Support

Turbo-MTP is an implementation of Microsoft's MTP enabled by West Bridge. In the current generation of MTP-enabled mobile phones, all protocol packets need to be handled by the main processor. West Bridge Turbo-MTP switches these packet types and sends only control packets to the processor, while data payloads are written directly to mass storage, thereby bringing the high performance of West Bridge to MTP. For more information refer to the application note [Optimizing Performance using West Bridge® Controllers with Turbo-MTP](#).

SLIM Architecture

The SLIM architecture enables three different interfaces (P-port, S-port, and U-port) to connect to one another independently.

With this architecture, connecting a device using Astoria to a PC through USB does not disturb any of the functions of the device. The device can still access mass storage at the same time as the PC synchronizes with the main processor.

The SLIM architecture enables new usage models in which a PC can access a mass storage device independent of the main processor or enumerate access to both the mass storage and the main processor at the same time.

In a handset, this typically enables using the phone as a thumb drive, downloading media files to the phone while still having full functionality available on the phone, or using the same phone as a modem to connect the PC to the web.

8051 Microprocessor

The 8051 microprocessor embedded in Astoria does basic transaction management for all the transactions between P-Port, S-Port, and U-Port. The 8051 does not reside in the data path; it manages the path. The data path is optimized for performance. The 8051 executes firmware that supports SD, SDIO, MMC+, and CE-ATA devices at the S-Port.

Configuration and Status Registers

The West Bridge Astoria device includes configuration and status registers that are accessible as memory mapped registers through the processor interface. The configuration registers allow the system to specify certain Astoria behaviors. For example, it is able to mask certain status registers from raising an interrupt. The status registers convey various status such as the addresses of buffers for read operations.

Processor Interface (P-Port)

Communication with the external processor is realized through a dedicated processor interface. This interface is configured to support different interface standards. This interface supports multiplexing and nonmultiplexing address or data bus in both synchronous and asynchronous pseudo CRAM-mapped, and nonmultiplexing address or data asynchronous SRAM-mapped memory accesses. The interface also can be configured to a pseudo NAND interface to support the processor's NAND interface. In addition, this interface can be configured to support SPI slave. Asynchronous accesses can reach a bandwidth of up to 66.7 MBps. Synchronous accesses can be performed at 33 MHz across 16 bits for up to 66.7 MBps bandwidth. The

P-Port of the WLCSP package only supports PNAND and SPI interface.

The memory address is decoded to access any of the multiple endpoint buffers inside Astoria. These endpoints serve as buffers for data between each pair of ports, for example, between the processor port and the USB port. The processor writes and reads into these buffers through the memory interface.

Access to these buffers is controlled by either using a DMA protocol or using an interrupt to the main processor. These two modes are configurable by the external processor. The 81-ball WLCSP package only supports interrupt.

As a DMA slave, Astoria generates a DMA request signal to signify to the main processor that a specific buffer is ready to be read from or written to. The external processor monitors this signal and polls Astoria for the specific buffers ready for read or write. It then performs the appropriate read or write operations on the buffer through the processor interface. This way, the external processor only deals with the buffers to access a multitude of storage devices connected to Astoria.

In the interrupt mode, Astoria communicates important buffer status changes to the external processor using an interrupt signal. The external processor then polls Astoria for the specific buffers ready for read or write and it performs the appropriate read or write operations through the processor interface.

FlexBoot

FlexBoot is an optional feature that Astoria emulates a NAND Flash device. In this optional feature, the P-Port is configured as pseudo NAND interface. The processor can download its boot image through the P-Port.

When P-Port is configured to pseudo NAND interface, it supports two operation modes:

- Logic NAND Access (LNA) mode
- Non-Logic NAND Access (non-LNA) mode

LNA refers to the mode of operation where Astoria emulates a NAND flash device. This mode is designed for systems that require booting of the system processor from a NAND Flash device. In this type of application, the system processor can communicate to Astoria using common NAND commands to boot from a NAND Flash connected to Astoria's S-port. In this mode of operation, Astoria mimics a real NAND device and allows the system processor to use its internal boot-ROM to boot from Astoria, as it boots from a NAND Flash.

In the non-LNA mode of operation, the system processor interfaces with Astoria using standard NAND interface, but does not use standard NAND commands. In this mode, Astoria responds to a subset of NAND commands. The system processor uses a set of APIs provided by Cypress to communicate through its NAND controller to Astoria. For details, refer to the application note ["Interfacing To West Bridge™ Astoria's™ Pseudo-NAND Processor Port"](#).

USB Interface (U-Port)

In accordance with the USB 2.0 specification, Astoria can operate in both full speed and high speed USB modes. The USB interface consists of the USB transceiver and can be accessed by both the P-Port and the S-Port.

The Astoria USB interface supports programmable CONTROL/BULK/INTERRUPT/ISOCRONOUS endpoints.

Astoria also has an integrated USB switch (see [Figure 1](#)) that allows interfacing to an external full speed USB PHY.

Figure 1. U-Port With Switch and Control Block

Mass Storage Support (S-Port)

The S-Port is configurable in five different interface modes:

- Simultaneously supporting an SD/SDIO/MMC+/CE-ATA port and an GPIF
- Supporting two SD/SDIO/MMC+/CE-ATA ports
- Supporting SD/SDIO/MMC+/CE-ATA port and GPIO
- Supporting GPIF and GPIO
- Supporting GPIO

These configurations are controlled by the 8051 firmware.

S-Port Configuration Modes

The S Port is configurable in six different interface modes:

- GPIF and SD/SDIO/MMC/CE-ATA interface mode
- Dual SD/SDIO/MMC/CE-ATA interface mode
- SD/SDIO/MMC/CE-ATA and GPIO interface mode
- GPIF and GPIO interface mode
- GPIO interface mode

GPIF and SD/SDIO/MMC/CE-ATA Interface Mode

This mode configures the S-Port into GPIF and SD/SDIO/MMC/MMC+/CE-ATA ports as shown in [Figure 2](#). The SD/SDIO/MMC/MMC+/CE-ATA port supports either SD, SDIO, MMC, MMC+, or CE-ATA device.

Figure 2. GPIF and SD/SDIO/MMC/CE-ATA Interface Mode

Dual SD/SDIO/MMC/CE-ATA Interface Mode

The dual SD/SDIO/MMC/MMC+/CE-ATA interface mode configures the S-Port for up to two SD/SDIO/MMC/MMC+/CE-ATA port as shown in [Figure 3](#). Each SD/SDIO/MMC/MMC+/CE-ATA port is independent and supports different SD, SDIO, MMC, MMC+, or CE-ATA devices.

Figure 3. Dual SD/SDIO/MMC/CE-ATA Interface Mode

SD/SDIO/MMC/CE-ATA and GPIO Interface

The SD/SDIO/MMC/MMC+/CE-ATA and GPIO interface mode configures the S-Port to support SD/SDIO/MMC/MMC+/CE-ATA device and GPIOs as shown in [Figure 4](#). Each GPIO is configured as either input or output independently. The processor accesses those GPIO through the P-Port driver's API.

Figure 4. SD/SDIO/MMC/CE-ATA and GPIO Interface Mode

GIPIF and GPIO Interface

The GIPIF and GPIO interface mode configure the S-Port to support GIPIF and GPIO as shown in Figure 5. Each GPIO is configured as either input or output independently. The processor accesses those GPIO through the P-Port driver's API.

Figure 5. GIPIF and GPIO Interface Mode

GPIO Interface Mode

The GPIO interface mode configures the S-Port to all GPIO as shown in Figure 6. Each GPIO is configured as either input or output independently. The processor accesses those GPIO through the P-Port driver's API.

Figure 6. GPIO Interface Mode

SD/SDIO/MMC+/CE-ATA Port (S-Port)

When Astoria is configured with firmware to support SD, SDIO, MMC+, and CE-ATA, this interface supports:

- The Multimedia Card System Specification, MMCA Technical Committee, Version 4.1
- SD Memory Card Specification – Part 1, Physical Layer Specification, SD Group, Version 1.10, October 15, 2004
- SD Memory Card Specification – Part 1, Physical Layer Specification, SD Group, Version 2.0, May 9, 2006

- SD Specifications – Part E1 SDIO Specification, Version 1.10, August 18, 2004

- CE-ATA Specification – CE-ATA Digital Protocol, CE-ATA Committee, Version 1.1, September, 2005

West Bridge Astoria provides support for 1-bit and 4-bit SD; SDIO cards; 1-bit, 4-bit, and 8-bit MMC; MMC+ cards; and CE-ATA drive. For the SD, SDIO, MMC/MMC Plus, and CE-ATA, this block supports one card for one physical bus interface.

Astoria supports SD commands including the multisector program command that are handled by the API.

GPIO Port (S-Port)

The GPIO in S-Port is configurable as either input or output direction independently. The processor accesses the GPIO through the P-Port driver's API.

Clocking

Astoria allows connection of a crystal between the XTALIN and XTALOUT pins or an external clock at the XTALIN pin. The 81-ball WLCSP package only supports the external clock. The power supply level at the crystal supply XVDDQ determines whether a crystal or a clock is provided. If XVDDQ is detected to be 1.8 V, Astoria assumes that a clock input is provided. For a crystal to be connected, XVDDQ must be 3.3 V.

Note Clock inputs at 3.3 V level are not supported.

Astoria's 100-ball VFPGA package supports external crystal and clock inputs at 19.2, 24, and 26 MHz frequencies. At 48 MHz, only clock inputs are supported. The 81-ball SPWLCSP only supports 19.2 and 26 MHz external clock input. The 81-ball Lite SP WLCSP only supports 26 MHz external clock or crystal input. The crystal or clock frequency selection is shown in Table 1 on page 6, Table 2 on page 6, and Table 3 on page 6.

The XTALIN frequency is independent of the clock and data rate of the 8051 microprocessor or any of the device interfaces (including P-Port and S-Port). The internal PLL applies the proper clock multiply option depending on the input frequency.

For applications that use an external clock source to drive XTALIN, the XTALOUT pin must be left floating. The external clock source must also stop high or low and not toggle, to achieve the lowest possible current consumption. The requirements for an external clock source are shown in Table 4 on page 6.

Astoria has an on-chip oscillator circuit that uses an external 19.2, 24, and 26 MHz (± 150 ppm) crystal with the following characteristics:

- Parallel resonant
- Fundamental mode
- 1 mW drive level
- 12 pF (5% tolerance) load capacitors
- 150 ppm

Figure 7. Crystal Configuration

* 12 pF capacitor values assumes a trace capacitance of 3 pF per side on a four layer FR4 PCA

Parameter	Description	Specification		Unit
		Min	Max	
Vn (AVDDQ)	Supply voltage noise at frequencies < 50 MHz	–	20	mV p-p
PN_100	Input phase noise at 100 Hz	–	–75	dBc/Hz
PN_1k	Input phase noise at 1 kHz offset	–	–104	dBc/Hz
PN_10k	Input phase noise at 10 kHz offset	–	–120	dBc/Hz
PN_100k	Input phase noise at 100 kHz offset	–	–128	dBc/Hz
PN_1M	Input phase noise at 1 MHz offset	–	–130	dBc/Hz
	Duty cycle	30	70	%
	Maximum frequency deviation	–	150	ppm
	Overshoot	–	3	%
	Undershoot	–	–3	%

Power Domains

Astoria has multiple power domains that serve different purposes within the chip.

- VDDQ refers to a group of four independent supply domains for the digital I/Os. The nominal voltage level on these supplies are 1.8 V, 2.5 V, or 3.3 V. The three separate I/O power domains are:
 - PVDDQ – P-Port Processor interface I/O
 - SNVDDQ – S-Port GPIF interface I/O
 - SSVDDQ – S-Port SD interface I/O
 - GVDDQ – Other miscellaneous I/O
- UVDDQ is the 3.3-V nominal supply for the USB I/O and some analog circuits. It also supplies power to the USB transceiver
- VDD33 supply is required for the power sequence control circuits. For more details, see [Pin Assignments on page 9](#).

- VDD is the supply voltage for the logic core. The nominal supply voltage level is 1.8 V. This supplies the core logic circuits. The same supply must also be used for AVDDQ

- AVDDQ is the 1.8 V supply for PLL and USB serializer analog components. The same supply must also be used for VDD. The maximum permitted noise on AVDDQ is 20 mV p-p

- XVDDQ is the clock I/O supply; 3.3 V for XTAL or 1.8 V for an external clock

Noise guideline for all supplies except AVDDQ is a maximum of 100 mV p-p. All I/O supplies of Astoria must be ON when a system is active even if Astoria is not in use. The core VDD can also be deactivated at any time to preserve power if there is a minimum impedance of 1 kΩ between the VDD pin and ground. All I/Os tristate when the core is disabled.

Figure 8. Astoria Power Supply Domains

Power Supply Sequence

The power supplies are independently sequenced without damaging the part. All power supplies must be up and stable before the device operates. If the supplies are not stable, the remaining domains are in low power (standby) state.

Power Modes

In addition to the normal operating mode, Astoria contains several low power states when normal operation is not required.

Normal Mode

Normal mode is the mode in which Astoria is fully functional. In this mode, data transfer functions described in this document are performed.

Suspend Mode

This mode is entered internally by 8051 (the external processor only initiates entry into this mode through Mailbox commands). This mode is exited by the D+ bus going low, GPIO[0] going to a pre-determined state or by asserting CE# LOW.

In Astoria's suspend mode:

- The clocks are shut off
- All I/Os maintain their previous state
- Core power supply must be retained
- The states of the configuration registers, endpoint buffers, and the program RAM are maintained. All transactions must be complete before Astoria enters suspend mode (state of outstanding transactions are not preserved)
- The firmware resumes its operation from where it was suspended because the program counter is not reset
- Only inputs that are sensed are RESET#, GPIO[0]/SD_CD, GPIO[1]/SD2_CD, SD_D3, SD2_D3, D+, and CE#. The last three are wake up sources (each can be individually enabled or disabled)
- Hard Reset can be performed by asserting the RESET# input, and Astoria is initialized

Standby Mode

Standby mode is a low-power state. This is the lowest power mode of Astoria while still maintaining external supply levels.

This mode is entered through the deassertion of the WAKEUP input pin or through internal register settings. To leave this mode, assert the WAKEUP, CE#, and RESET#; change state of GPIO[0]/SD_CD, GPIO[1]/SD2_CD, SD_D3, and SD2_D3.

In this mode all configuration register settings and program RAM contents are preserved. However, data in the buffers or other parts of the data path, if any, is not guaranteed in values. Therefore, the external processor must ensure that the required data is read before placing Astoria in the standby mode.

In the standby mode:

- The program counter is reset on waking up from standby mode
- All outputs are tristated and I/O is placed in input only configuration. Values of I/Os in standby mode are listed in the pin assignments table
- Core power supply must be retained
- Hard Reset can be performed by asserting the RESET# input, and Astoria is initialized
- PLL is disabled
- USB switches the SWD+/SWD- to D+/D-

Core Power Down Mode

The core power supply V_{DD} is powered down in this state. Because AVDDQ is tied to the same supply as V_{DD} , it is also powered down. The endpoint buffers, configuration registers, and program RAM do not maintain state. All VDDQ power supplies (except AVDDQ) must be ON and not power down in this mode. VDD33 must also remain ON. It has an option that the UVDDQ can be powered down or stay ON while V_{DD} is powered down when SWD+/SWD- are not connected. The UVDDQ cannot be powered down when SWD+/SWD- is connected, or V_{DD} is active. When UVDDQ is powered down, D+/D- cannot be driven by an external device.

In the WLCSP package, AVDDQ is internally tied to XVDDQ. Due to this, the clock input at XTALIN must be brought to a steady low level prior to entry into Core Power Down Mode. In the WLCSP package, VDD33 is tied to UVDDQ internally. UVDDQ must be ON during the core power down mode

The core power down mode has two power down options:

- Core only power down – VDD power down
- Core and USB power down – VDD and UVDDQ are both powered down. In this option, SWD+/SWD- are not connected and cannot be driven by an external device

In these power down options, the endpoint buffers, configuration registers, or the program RAM do not maintain state. It is necessary to reload the firmware on exiting from this mode. All VDDQ power supplies must be ON and not powered down in this mode.

In the 82-ball WLCSP package, in the core power down mode, the USB switches the SWD+/SWD- to D+/D-.

Packages and Interface Options

Astoria provides one 100-ball VFBGA, one 100-ball BGA, one 121-ball FBGA and two types of 81-ball WLCSP packages. The two WLCSP packages are SP WLCSP and Lite SP WLCSP. These two packages have different interface options as listed in Table 5. The 100-ball VFBGA/BGA package pin list is listed in Table 6 on page 9, the 81-ball SP CSP package is listed in Table 10 on page 21, and the 81-ball Lite SP CSP package in Table 11 on page 24.

Table 5. Interface Options for 100-ball VFBGA, 81-ball SP, and 81-ball Lite SP

Package	P-Port						S-Port				Clock		
	PCRAM	SRAM	ADM	PNAND	I ² C	SPI	SD1	SD2	GPIF	GPIO	Ext CLK	Crystal	Freq. (MHz)
100-ball BGA / VFBGA	√	√	√	√	√	√	√	√	√	√	√	√	19.2, 24, 26, 48

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature	-65 °C to +150 °C
Ambient temperature with power supplied (Industrial)	-40 °C to +85 °C
Supply voltage to ground potential VDD, AVDDQ	-0.5 V to +2.0 V
GVDDQ, PVDDQ, SSVDDQ, SNVDDQ, UVDDQ, and VDD33 and XVDDQ	-0.5 V to +4.0 V
DC input voltage to any input pin (Depends on I/O supply voltage. Inputs are not overvoltage tolerant.)	1.89 V to 3.6 V
DC voltage applied to outputs in High Z state	-0.5 V to VDDQ + 0.5 V
Static discharge voltage (ESD) from JESD22-A114	> 2000 V
Latch up current	> 200 mA
Maximum output short circuit current for all I/O configurations. (Vout = 0 V) [1]	-100 mA

Operating Conditions

T _A (ambient temperature under bias)	
Industrial	-40 °C to +85 °C
VDD, AVDDQ supply voltage	1.7 V to 1.9 V
UVDDQ supply voltage	3.0 V to 3.6 V
PVDDQ, GVDDQ, SNVDDQ, SSVDDQ supply voltage	1.7 V to 3.6 V
XVDDQ (Crystal I/O) supply voltage	3.0 V to 3.6 V
XVDDQ (Ext. Clock I/O) supply voltage	1.7 V to 1.9 V

Note

1. Do not test more than one output at a time. Duration of the short circuit must not exceed one second. Tested initially and after any design or process changes that may affect these parameters

DC Characteristics

Table 12. DC Specifications for All Voltage Supplies (Except USB Switch)

Parameter	Description	Conditions	Min	Typ	Max	Unit	
V _{DD}	Core voltage supply		1.7	1.8	1.9	V	
AVDDQ	Analog voltage supply		1.7	1.8	1.9	V	
XVDDQ	Crystal voltage supply		3.0	3.3	3.6	V	
XVDDQ	Clock voltage supply		1.7	1.8	1.9	V	
PVDDQ ^[4]	Processor interface I/O		1.7	1.8, 2.5, 3.3	3.6	V	
GVDDQ ^[4]	Miscellaneous I/O voltage supply		1.7	1.8, 2.5, 3.3	3.6	V	
SNVDDQ ^[3, 4]	S-Port GPIF voltage supply		1.7	1.8, 2.5, 3.3	3.6	V	
SSVDDQ ^[3, 4]	S-Port SD I/O voltage supply		1.7	1.8, 2.5, 3.3	3.6	V	
UVDDQ ^[6]	USB voltage supply		3.0	3.3	3.6	V	
VDD33	Power sequence control supply		3.0	3.3	3.6	V	
V _{IH1} ^[5]	Input HIGH voltage 1	All ports except USB, 2.0 V ≤ V _{CC} ≤ 3.6 V	0.625 × V _{CC}	–	V _{CC} + 0.3	V	
V _{IH2} ^[5]	Input HIGH voltage 2	All ports except USB, 1.7 V ≤ V _{CC} < 2.0 V	V _{CC} – 0.4	–	V _{CC} + 0.3		
V _{IL}	Input LOW voltage		–0.3	–	0.25 × V _{CC}	V	
V _{OH}	Output HIGH voltage	I _{OH} (MAX) = –0.1 mA	0.9 × V _{CC}	–		V	
V _{OL}	Output LOW voltage	I _{OL} (MIN) = 0.1 mA		–	0.1 × V _{CC}	V	
I _{IX}	Input leakage current	All I/O signals held at VDDQ	–1	–	1	μA	
I _{OZ}	Output leakage current	All I/O signals held at VDDQ	–1	–	1	μA	
I _{CC} Core	Operating current of core voltage supply (V _{DD}) and analog voltage supply (AVDDQ)	VFBGA package outputs tri-stated	–	–	110	mA	
		WLCSP package outputs tri-stated	–	–	115	mA	
I _{CC} Crystal	Operating current of crystal voltage supply (XVDDQ) ^[8]	VFBGA package XTALOUT floating	–	–	5	mA	
		WLCSP package	–	–	N/A		
I _{CC} USB	Operating current of USB voltage supply (UVDDQ) ^[8]	Operating and terminated for high speed mode	–	–	25	mA	
I _{SB1} (For 100-ball VFBGA and 81-ball SP WLCSP-Packages)	Total standby current of Astoria when device is in suspend mode	1. *VDDQ = 3.3 V nominal (3.0–3.6 V) 2. Outputs and Bidirs high or floating ^[7] 3. XTALOUT floating 4. D+ floating, D–grounded 5. Device in suspend mode	25 °C	–	300 ^[2]	–	μA
			85 °C	–	–	3000	μA

Notes

- I_{SB1} typical value is not a maximum specification but a typical value. I_{SB1} maximum current value specified for 85°C.
- The SSVDDQ I/O voltage can be dynamically changed (for example, from high range to low range) as long as the supply voltage undershoot does not surpass the lower minimum voltage limit. SSVDDQ and SNVDDQ levels for SD modes: 2.0 V–3.6 V, MMC modes: 1.7 V–3.6 V.
- Interfaces with a voltage range are adjustable with respect to the I/O voltage and supports multiple I/O voltages.
- V_{CC} = pertinent VDDQ value.
- When U-Port is in a disabled state, UVDDQ can go down to 2.4 V, provided UVDDQ is still the highest supply voltage level.
- The Outputs and Bidirs that are forced low in standby mode can increase I/O supply standby current beyond specified value.
- Active Current Conditions:
-UVDDQ: USB transmitting 50% of the time, receiving 50% of the time.
-PVDDQ/SNVDDQ/SSVDDQ/GVDDQ: Active current depends on I/O activity, bus load and supply level.
-XVDDQ: Assume highest frequency clock (48 MHz) or crystal (26 MHz).

Table 12. DC Specifications for All Voltage Supplies (Except USB Switch) (continued)

Parameter	Description	Conditions	Min	Typ	Max	Unit	
I _{SB1} (For 81-ball Lite SP WLCSP)	Total standby current of Astoria when device is in suspend mode	6. *VDDQ = 3.3 V nominal (3.0–3.6 V) 7. Outputs and Bidirs high or floating ^[7] 8. XTALOUT floating 9. D+ floating, D– grounded 10. Device in suspend mode	25 °C	TBD	TBD	TBD	μA
			85 °C	TBD	TBD	TBD	μA
I _{SB2}	Total standby current of Astoria when device is in standby mode	1. *VDDQ = 3.3 V Nominal (3.0–3.6 V) 2. Outputs and Bidirs High or Floating ^[7] 3. XTALOUT Floating 4. D+ Floating, D– Grounded	25 °C	–	–	52	μA
			85 °C	–	–	450	μA
I _{SB3}	Total standby current of Astoria when device is in core power-down mode	1. Outputs and Bidirs High or Floating ^[7] 2. XTALOUT Floating 3. D+ Floating, D– Grounded 4. Core Powered Down	25 °C	–	–	28	μA
			85 °C	–	–	139	μA

Table 13. USB Switch DC Specifications

Parameter	Description	Conditions	Min	Typ	Max	Unit
V _{IH}	Input voltage HIGH		1.6	–	–	V
V _{IL}	Input voltage LOW		–	–	0.8	V
R _{ON}	On resistance		4.5	7	10	Ω
R _{OFF}	Off resistance		1M	–	–	Ω
C _{DP/DM_ON}	D+/D– on capacitance (with Full-Speed switch On)		–	–	25	pF
C _{DP/DM_OFF}	D+/D– off capacitance		–	–	20	pF

Table 14. Capacitance

Parameter	Description	Conditions	Typ	Max	Unit
C _{IN}	Input pin capacitance, except D+/D–	TA = 25 °C, f = 1 MHz, V _{CC} = V _{CCIO}	–	9	pF
	Input pin capacitance, D+/D–		–	15	pF
C _{OUT}	Output pin capacitance		–	10	pF

tDW	Data setup to write end	18	–	ns
tDH	Data hold from write end	0	–	ns
tWHZ	Write to DQ High Z output	–	22.5	ns
tOW	End of write to Low Z output	3	–	ns

Notes

9. In applications where access cycle time is at least 60 ns, t_{VPH} can be relaxed to 12 ns.

10. In applications where back-to-back accesses are not performed on different endpoint addresses, the minimum t_{AVH} spec. can be relaxed to 0 ns.

Figure 37. PNAND Mode Status Read Cycle

Figure 38. PNAND LBD Read Operation

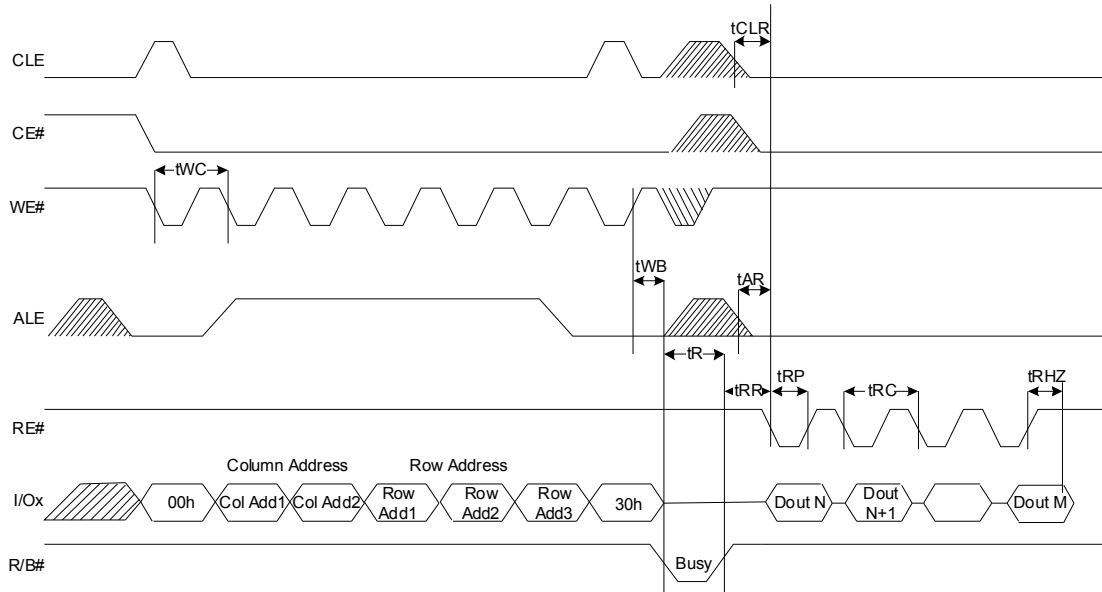

Table 21. Page-Read Command Sequence for Large-Block Devices

Cycle type	IO bus	Comments
CMD0	00h	Page-read command - 1 st cycle
CA0	EP_Offset[7:0]/ REG_Addr[7:0]	REG_Sel field determines how the two column address cycles are interpreted EP_Offset[11:10] = REG_Sel = 2'b11 ‡ Register EP_Offset[11:10] = REG_Sel = 2'b0x, 2'b10 ‡EP buffer offset EP_Offset[11:0] = EP buffer offset
CA1	{4'b0000, EP_Offset[11:8]}	
RA0	Row address byte 0	First row-address cycle RA0[4:0] = default EPA – Endpoint address
RA1	Row address byte 1	The number row-address bytes present in Page-read command depend on RA_COUNT configuration parameter setting. LNA row addresses are interpreted by firmware;
RA2	Row address byte 2	
RA3	Row address byte 3	
CMD1	30h	Page-read command - 2 nd cycle
Data[0-2111]	Data	Data is returned by Astoria delay tR beyond the second command.

Figure 39. PNAND LBD Read Operation

Figure 40. PNAND SBD Read Operation

Table 22. Page-Read Command Sequence for Small-Block Devices

Cycle type	IO bus	Comments
CMD0	00h/01h/50h	Sets base-address within page as 0, 256, or 512, for read operation.
CA0	EP_Offset[7:0]/ REG_Addr[7:0]	EP_Offset[7:0] = EP buffer offset for non-register accesses. REG_Addr[7:0] specifies register address when EPA[4:0] field = 5'b10000.
RA0	Row address byte 0	First row-address cycle RA0[4:0] = default EPA – Endpoint address EPA may be specified in any other row-address byte.
RA1	Row address byte 1	The number row-address bytes present in Page-read command depend on RA_COUNT configuration parameter setting. LNA row addresses are interpreted by firmware;
RA2	Row address byte 2	
RA3	Row address byte 3	
Data[0-527]	Data	Data is returned by Astoria delay tR beyond the second command.

SPI and PI2C Interface

Table 23. SPI Mode Parameters

Parameter	Description	Min	Max	Units
f _{OP}	Operating frequency	0	26	MHz
t _{CYC}	Cycle time	38.5	–	ns
t _{Lead}	Enable lead time	19.23	–	ns
t _{Lag}	Enable lag time	19.23	–	ns
t _{SCKH}	Clock high time	17.33	–	ns
t _{SCKL}	Clock low time	17.33	–	ns
t _{SU}	Data setup time (inputs)	–	7	ns
t _H	Data hold time (inputs)	–	7	ns
t _V	Data valid time, after enable edge	–	18	ns
t _{HO}	Data hold time, after enable edge	0	–	ns

Figure 57. SPI Timing Diagram

Note: Not defined but normal MSB of character just received

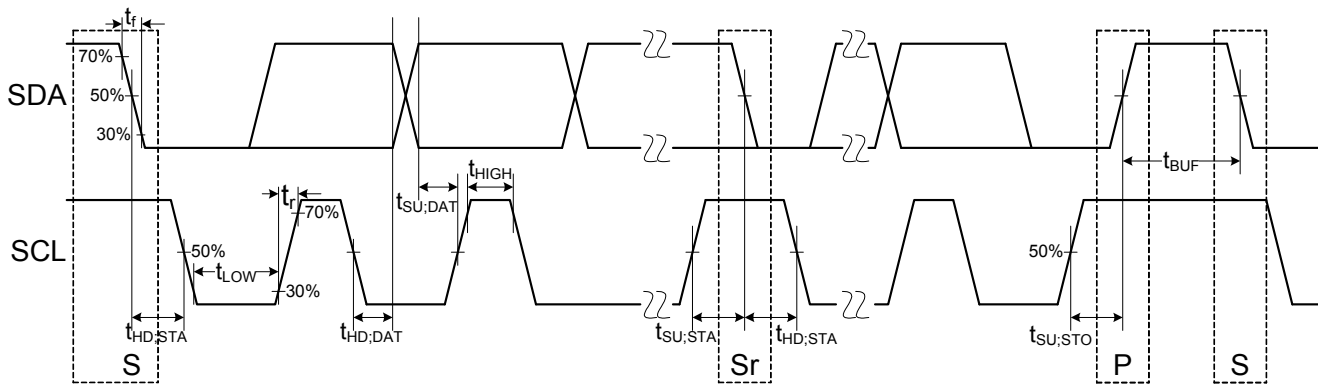

Table 24. I2C Interface Standard Mode Parameters

Parameter	Description	Min	Max	Units
F	Operating frequency	0	82	kHz
t _{BUF}	Bus free time (between stop and start conditions)	4.7	–	μs
t _{HD:STA}	Hold time after (Repeated) start condition. After this period the first clock is generated	4.0	–	μs
t _{SU:STA}	Repeated start condition setup time	4.7	–	μs
t _{SU:STO}	Stop condition setup time	4.0	–	μs
t _{HD:DAT}	Data hold time	0	–	ns
t _{SU:DAT}	Data setup time	250	–	ns
t _{TIMEOUT}	Detect clock low timeout	NA		ms
t _{LOW}	Clock low period	4.7	–	μs
t _{HIGH}	Clock high period	4.0	–	μs
t _{LOW:SEXT}	Cumulative clock low extend time (slave device)	NA		ms
t _r	Rise time	–	1000	ns
t _f	Fall time	–	300	ns

Table 25. I2C Interface Fast Mode Parameters

Parameter	Description	Min	Max	Units
F	Operating frequency	0	312	kHz
t _{BUF}	Bus free time (between stop and start condition)	1.3	–	μs
t _{HD:STA}	Hold time after (Repeated) start condition. After this period the first clock is generated	0.6	–	μs
t _{SU:STA}	Repeated start condition setup time	0.6	–	μs
t _{SU:STO}	Stop condition setup time	0.6	–	μs
t _{HD:DAT}	Data hold time	0	0.9	ns
t _{SU:DAT}	Data setup time	100	–	ns
t _{TIMEOUT}	Detect clock low timeout	NA		ms
t _{LOW}	Clock low period	1.3	–	μs
t _{HIGH}	Clock high period	0.6	–	μs
t _{LOW:SEXT}	Cumulative clock low extend time (slave device)	NA		ms
t _r	Rise time	–	300	ns
t _f	Fall time	–	300	ns

Figure 58. I2C Timing Diagram

Other P-Port Timings

DRQ# Min Pulse Width (tDPW): The minimum duration that DRQ# is deasserted following a DRQ acknowledgement (clear of DMAVAL) is 110 ns in Async mode or five P-Port clock (CLK) cycles in Sync mode.

Same Register Write-to-Read Holdoff (tWRHO): A read of a particular register must wait for a holdoff period following a write operation to that same register address to ensure that valid updated data is read. In Async mode, this holdoff time is 150 ns.

In Sync mode, this holdoff time is seven P-Port clock (CLK) cycles.

Register Update-to-Read Holdoff (tURHO): Same status registers are updated as side effect from accesses to other registers. For example, clearing the DMAVAL field automatically clears the associated endpoint buffer bit within the DRQ status register. A holdoff time must elapse from the first register access before the update is reflected in a subsequent read operation. This holdoff time is identical to the tWRHO.

S Port Interface AC Timing Parameters

SD/MMC/MMC+/CE-ATA Timing Parameters

For all conditions, SD/MMC data is driven and sampled on the rising edge of SD_CLK. Note that CE-ATA electrical and timing parameters are equivalent to MMC.

Figure 59. SD/MMC/CE-ATA Timing Waveform – All Modes

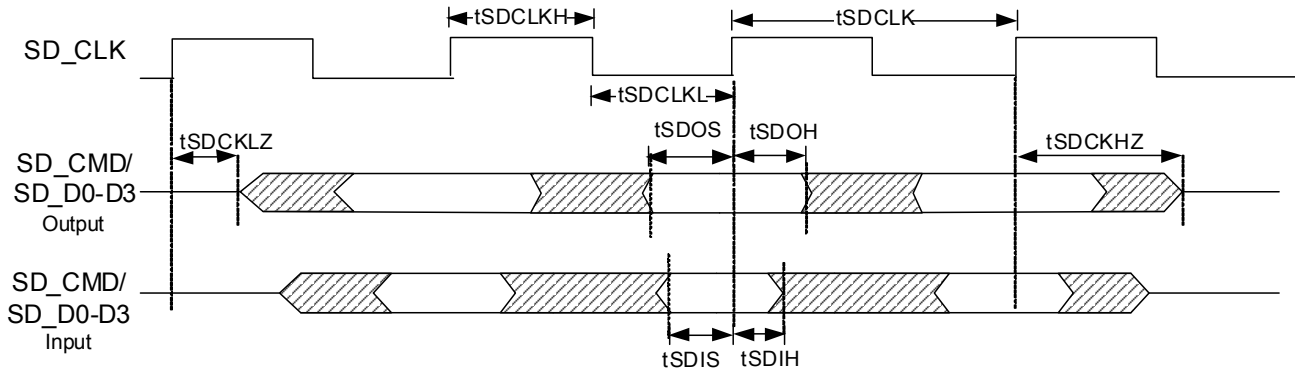

Table 26. Common Timing Parameters for SD/MMC/CE-ATA – During Identification Mode

Parameter	Description	Min	Max	Units
SDFREQ	SD_CLK interface clock frequency	0	400	kHz
tSDCLK	Clock period	2.5	–	μs
tSDCLKH	Clock high time	1.0	–	μs
tSDCLKL	Clock low time	1.0	–	μs

Table 27. Common Timing Parameters for SD/MMC/CE-ATA – During Data Transfer Mode

Parameter	Description	Min	Max	Units
SDFREQ	SD_CLK interface clock frequency	5	48	MHz
tSDCLK	Clock period	20.8	200	ns
tSDCLKOD	Clock duty cycle	40	60	%
tSCLKR	Clock rise time	–	3	ns
tSCLKF	Clock fall time	–	3	ns

Table 28. Timing Parameters for SD – All Modes

Parameter	Description	Min	Max	Units
tSDIS	Input setup time	4	–	ns
tSDIH	Input hold time	2.5	–	ns
tSDOS	Output setup time	7	–	ns
tSDOH	Output hold time	6	–	ns
tSDCKHZ	Clock to data High Z	–	18	ns
tSDCKLZ	Clock to data Low Z	3	–	ns

Table 29. Timing Parameters for MMC/CE-ATA – All Modes

Parameter	Description	Min	Max	Units
tSDIS	Input setup time	4	–	ns
tSDIH	Input hold time	4	–	ns
tSDOS	Output setup time	6	–	ns
tSDOH	Output hold time	6	–	ns
tSDCKHZ	Clock to data High Z	–	18	ns
tSDCKLZ	Clock to data Low Z	3	–	ns

Reset and Standby Timing Parameters

The Astoria reset mechanism and the standby mode are described in this section.

Sleep Time (tSLP): The maximum time from deassertion of WAKEUP to when Astoria enters low power state (sleep mode) is 1 ms.

Wakeup Time (tWU): The minimum time from assertion of WAKEUP pin (or initial power on with WAKEUP HIGH) to when any register operation is conducted is 1 ms if an external clock is present, or 5 ms if a crystal is used. The CY_AN_MEM_PWR_MAGT_STAT.WAKEUP field can only be polled after wakeup time following reset deassertion or WAKEUP assertion.

Minimum RESET# pulse width (tRPW): 5 ms when a crystal is used as clock or 1 ms when an external clock is used.

Minimum WAKEUP pulse width (tWPW): 5 ms.

Minimum HIGH on RESET# and WAKEUP (tRH, TWH): The WAKEUP and RESET# pins must be held HIGH for a minimum of 5 ms.

Reset Recovery Time (tRR): A minimum 1 ms reset recovery time must be allowed before Astoria registers can be accessed for read or write.

Figure 60. Reset and Standby Timing Diagram

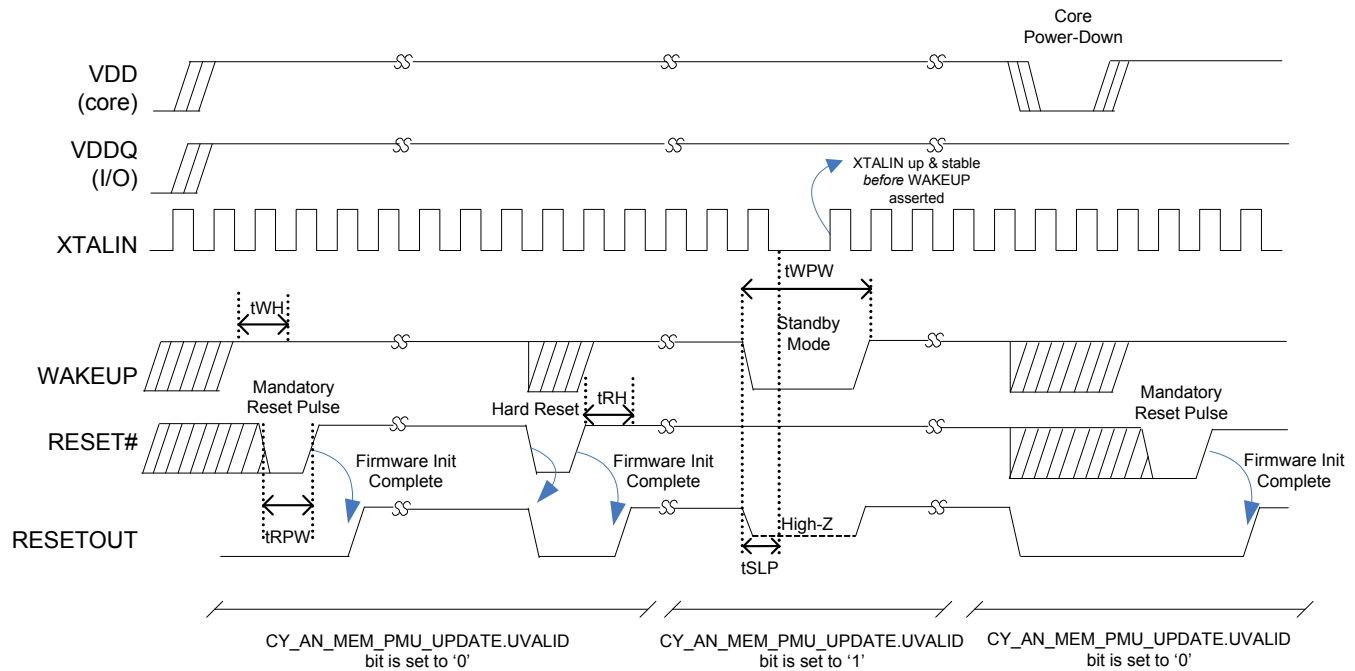

Table 30. Reset and Standby Timing Parameters

Parameter	Description	Conditions	Min	Max	Units
tSLP	Sleep time		–	1	ms
tWU	Wakeup time from standby mode	Clock on XTALIN	1	–	ms
		Crystal on XTALIN-XTALOUT	5	–	ms
tWH	WAKEUP high time		5	–	ms
tWPW	WAKEUP pulse width		5	–	ms
tRH	RESET# high time		5	–	ms
tRPW	RESET# pulse width	Clock on XTALIN	1	–	ms
		Crystal on XTALIN-XTALOUT	5	–	ms
tRP	RESET# recovery time		1	–	ms

Figure 61. AC Test Loads and Waveforms (Except SD and MMC, SD and MMC are comply with the SD/MMC specification)

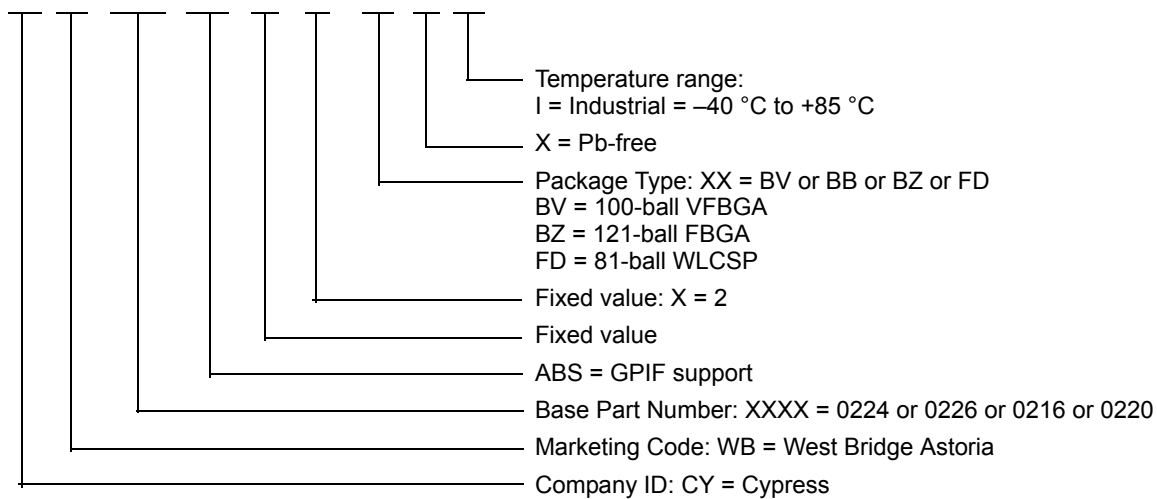

Ordering Information

Astoria provides many options with multiple ordering part numbers as shown in the following table:

Ordering Code	Package Type	Optional Features			Clock Input Frequencies (MHz)	Status
		FlexBoot™	USB Switch	Turbo MTP		
CYWB0220ABSX2-FDXIT	81-ball WLCSP (Pb-free)		√		26	Sample
CYWB0224ABM-BVXIES	100-ball VFBGA (Pb-free)				19.2, 24, 26, 48	Sample
CYWB0224ABS-BZXI	121-ball FBGA (Pb-free)				19.2, 24, 26, 48	Production
CYWB0224ABS-BVXI	100-ball VFBGA (Pb-free)				19.2, 24, 26, 48	Production
CYWB0224ABS-BVXIT	100-ball VFBGA (Pb-free)				19.2, 24, 26, 48	Production
CYWB0224ABS-BVXIES	100-ball VFBGA (Pb-free)				19.2, 24, 26, 48	Sample
CYWB0224ABSX-FDXI	81-ball WLCSP (Pb-free)				19.2, 26	Sample
CYWB0224ABSX-FDXIT	81-ball WLCSP (Pb-free)				19.2, 26	Production
CYWB0226ABS-BVXI	100-ball VFBGA (Pb-free)		√		19.2, 24, 26, 48	Production
CYWB0226ABS-BVXIT	100-ball VFBGA (Pb-free)		√		19.2, 24, 26, 48	Production
CYWB0226ABSX-FDXI	81-ball WLCSP (Pb-free)		√		19.2, 26	Sample
CYWB0226ABSX-FDXIT	81-ball WLCSP (Pb-free)		√		19.2, 26	Production

Document Title: CYWB022XX Family, West Bridge®: Astoria™ USB and Mass Storage Peripheral Controller Document Number: 001-13805				
Rev.	ECN No.	Orig. of Change	Submission Date	Description of Change
**	866960	VSO / PSZ	See ECN	New datasheet
*A	2208371	JYEE / VSO	See ECN	<p>1) Corrected the Pin name (R/B#) in Table 2, Updated I_{SB1} to I_{SB3} in Table 3, Updated Table 5, Updated Figure 14 to Figure 18 (timing diagrams), In Table 6, moved "Interface Bandwidth" to first row, Updated Table 7, Updated Figure 22, Added Figure 23 (new), Updated Figure 24 to 26, Updated Table 8, Updated Figure 27, Added Table 9 (Async SRAM mode Timing), Updated Figure 29 - 31, Updated Table 10, Updated Figure 32 - 43, Updated Table 11, Updated Table 12, Updated Figure 45, Updated Table 14, Added Table 16, and 21. Updated Figure 47.</p> <p>2) Added two part numbers (CYWB0226ABS and CYWB0226ABM) in the title, Modified Feature list (same as Astoria Advance Information), Updated Features to include "Integrated USB Switch", Updated Figure 1, Updated USB Interface (U-Port), Added Figure 2, Updated section 3.6, Updated Table 2, Updated Figure 14, Added Table 4, Updated Table 5-6, Updated Figure 15-19, Updated Table 7, Updated Figure 20-21, Updated Table 8, Updated Figure 22-27, Updated Table 9, Update Figure 28-29, Updated Table 10, Updated Figure 30-32, Updated Table 11, Updated Figure 33-54, Updated Table 12, Updated Figure 55, Updated Table 13-14, Updated Figure 56-58, Updated Table 15-16, Added Table 17-18, Updated Table 19, Updated Figure 59, and Added two part numbers (CYWB0226ABS and CYWB0226ABM) in the order information (section 9).</p>
*B	2503171	VSO / AESA	See ECN	<p>1. "Features" - added 3.91x3.91 mm 81-ball WLCSP to Small footprint bullet.</p> <p>2. "Processor Interface (P-Port)" - added "The P-Port of the WLCSP package only supports PNAND and SPI interface" and "The 81-ball WLCSP package only supports interrupt."</p> <p>3. "Clocking" - added "The 81-ball WLCSP only supports 19.2 and 26 MHz external clock input." and Tables 1 and 2</p> <p>4. Table 4 - added the column of "Ball #"</p> <p>5. Table 5 - added a new table for WLCSP pin assignment</p> <p>6. Figure 13 - removed the grid line</p> <p>7. Figure 14 - new ball map for WLCSP package</p> <p>8. Table 14 - add 33ns for t_{RC} and t_{WC} timing for WLCSP package</p> <p>9. Figure 55 - updated the SPI timing diagram</p> <p>10. "Ordering Information" - added WLCSP package ordering code to the table</p> <p>11. Add CYWB0224ABSX, CYWB0224ABMX CYWB0226ABSX, CYWB0226ABMX.</p>
*C	2521024	VSO / AESA	See ECN	<p>1. This version is final - Removed status "Preliminary"</p> <p>2. Update the section of "Core Power Down Mode"</p> <p>3. Note 3 of Table 6 has added the requirement of SSVDDQ and SNVDDQ in SD/MMC modes</p> <p>4. SNVDDQ in Table 6 added Note 3</p> <p>5. Table 17, add parameter t_{WH}</p> <p>6. Figure 22 and Figure 27 have been updated</p> <p>7. Table 18, add parameter t_{AVH}</p> <p>8. Figure 28 and Figure 29 have been updated</p> <p>9. Table 20, the value of parameters "t_{PROG}" and "t_R" have been updated</p> <p>10. Table 23, removed parameter of "t_A"</p> <p>11. Figure 58 I2C timing diagram has been updated</p>
