### Presettable Counters

CD54/74HC/HCT160 BCD Decade Counter, Asynchronous Reset  
 CD54/74HC/HCT161 4-Bit Binary Counter, Asynchronous Reset  
 CD54/74HC/HCT162 BCD Decade Counter, Synchronous Reset  
 CD54/74HC/HCT163 4-Bit Binary Counter, Synchronous Reset

#### Type Features:

- Synchronous Counting and Loading
- Two Count Enable Inputs for n-Bit Cascading
- Asynchronous Reset (CD54/74HC/HCT160, 161)
- Synchronous Reset (CD54/74HC/HCT162, 163)
- Look-Ahead Carry for High-Speed Counting

The RCA-CD54/74HC/HCT160, 161, 162, and 163 devices are presettable synchronous counters that feature look-ahead carry logic for use in high-speed counting applications. The CD54/74HC/HCT160 and 161 are asynchronous reset decade and binary counters, respectively; the CD54/74HC/HCT162 and 163 devices are decade and binary counters, respectively and are reset synchronously with the clock. Counting and parallel presetting are both accomplished synchronously with the negative-to-positive transition of the clock.

A low level on the synchronous parallel enable input,  $\overline{SPE}$ , disables the counting operation and allows data at the P0 to P3 inputs to be loaded into the counter (provided that the setup and hold requirements for  $\overline{SPE}$  are met).

All counters are reset with a low level on the Master Reset input,  $\overline{MR}$ . In the CD54/74HC/HCT162 and 163 counters (synchronous reset types), the requirements for setup and hold time with respect to the clock must be met.

Two count enables, PE and TE, in each counter are provided for n-bit cascading. In all counters reset action occurs regardless of the level of the  $\overline{SPE}$ , PE and TE inputs (and the clock input, CP, in the CD54/74HC/HCT160 and 161 types).

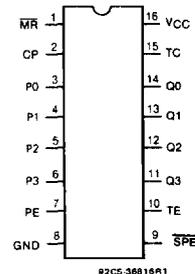

If a decade counter is preset to an illegal state or assumes an illegal state when power is applied, it will return to the normal sequence in one count as shown in state diagram.

The look-ahead carry feature simplifies serial cascading of the counters. Both count enable inputs (PE and TE) must be high to count. The TE input is gated with the Q outputs of all four stages so that at the maximum count the terminal count (TC) output goes high for one clock period. This TC pulse is used to enable the next cascaded stage.

The CD54HC160 through 163 and the CD54HCT160 through 163 are supplied in 16-lead hermetic dual-in-line ceramic packages (F suffix). The CD74HC160 through 163 and the CD74HCT160 through 163 are supplied in 16-lead dual-in-line plastic packages (E suffix), and in 16-lead dual-in-line surface mount plastic packages (M suffix). All types are also supplied in chip form (H suffix).
