

ELECTRONIC VOLUME CONTROL IC

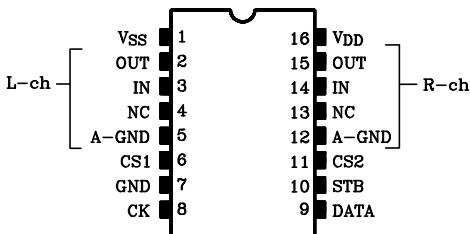

KIC9299P is electronic volume control IC developed for use in audio equipment such as home stereo sets. This IC control balance and rear speaker. The volume, balance and loudness circuits can be controlled by serial data which are input externally.

FEATURES

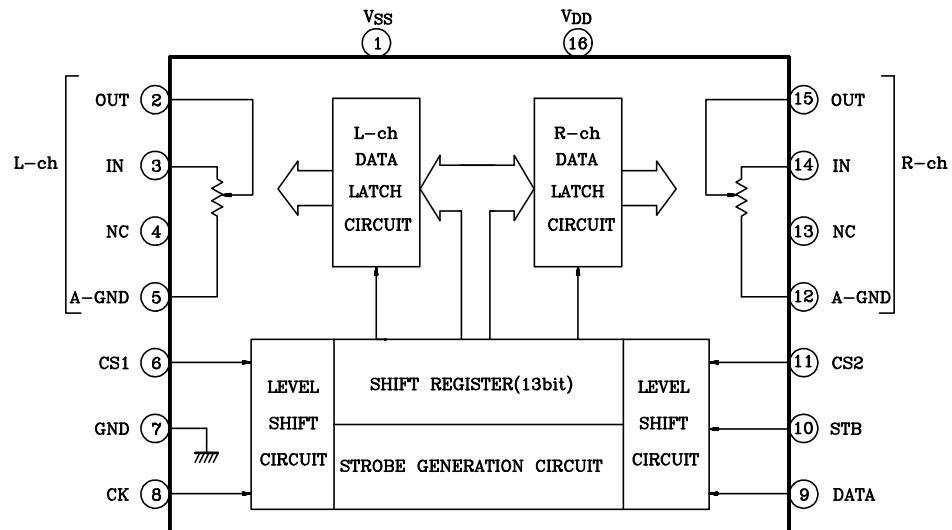

- Thirty-two level volume control in 1dB steps from 0dB to 30dB, ∞ dB.
- The volume circuit features 2 built-in channels which can be controlled independently, thus controlling balance.
- Signal and dual power supply operation.
- Chip select input allows control of up to four of these chips on the same bus.
- Polysilicon resistors enables low-distortion, high-performance volume systems.
- Package is DIP-16 pin.

APPLICATION CIRCUIT

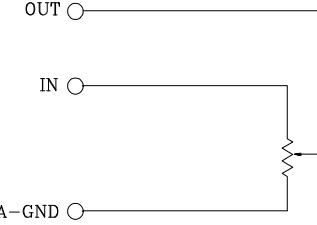

(Note) High-frequency digital signals are input to pins CK, DATA and STB.

Since these signals may cause noise in analog circuits, either use shield wire for CK, DATA, and STB signal lines, or design the pattern so that these signal lines are protected by the ground line.

OPERATIONS

1. Setting volume values (Attenuation)

The volume values are set using 13bit serial data.

- Data format

- (1) L is left channel select data, R is right channel select data.

When L=1, left channel volume is set. When R=1, right channel volume is set.
(When R=L=1, both channel volumes are set simultaneously)

- (2) 8, 9 bit data is set "0".

- (3) "D1"~"D5" are volume value setting data.

- (4) "C1"~"C4" are chip select code data.
Code data are set according to CS1 and CS2 input.

CS1	CS2	C1	C2	C3	C4

2. Serial data timing

Input CK, DATA, and STB according to the following timing.

3. Single and dual power supply operation
KIC9299P is operate with single or dual power supplies.
With single or dual power supply, serial data logic level can be 0~5V.

- Single power supply operation
- Dual power supply operation
