

# R2A20056BM

Lithium-Ion Battery Charger IC with Auto Load Current Distribution

R03DS0075EJ0100

Rev. 1.23

Apr 15,2013

## Description

R2A20056BM is a semiconductor integrated circuit designed for Lithium-ion battery charger control IC. Built-in Input current limitation circuit compliant with USB requirements and dual output (system and battery) control circuit allows to supply the system power and the battery charging power simultaneously from input power.

## Features

- Allows to USB charging
  - Automatic USB detection and automatic input current limitation setup (USB battery charging 1.2 and VBUS divided port)
  - Input current limitation is programmable by I2C
    - I<sup>2</sup>C 100mA/500mA/1000mA/1500mA/1800mA/Limitless/Suspend
- Weak battery charge function
- High precision charge control voltage : 4.2V+/-21mV (+/-0.5%)
- Auto load current distribution control
  - Auto power management between system load and battery charge within input current limitation
  - Built-in low Ron path switch (30mohm)
  - System output voltage regulation
    - Default position : V<sub>IN</sub> pass-through
    - Switching between V<sub>IN</sub> pass-through and V<sub>SYS45</sub>
- Compliance with JEITA guideline
  - Thermistor I/F detects battery temp. to control CC/CV parameters by built-in charge profile
- I2C interface
  - Adjustable charging parameters
- Protection function
  - Input UVLO/OVLO
  - Battery over voltage detection
  - Timer
  - Chip temperature detection
  - Thermal shutdown
- Recharge function
- Gate control for system Load SW (/SG)
- Input power OK output (/POK)
- Charge State output (/STAT)

## Application

- Digital Still Camera
- Digital Video Camera
- Mobile Phone
- PDA/PND
- Tablet/Note PC
- Portable Audio Player
- Portable Game Machine

<b>Pin function</b>
---------------------

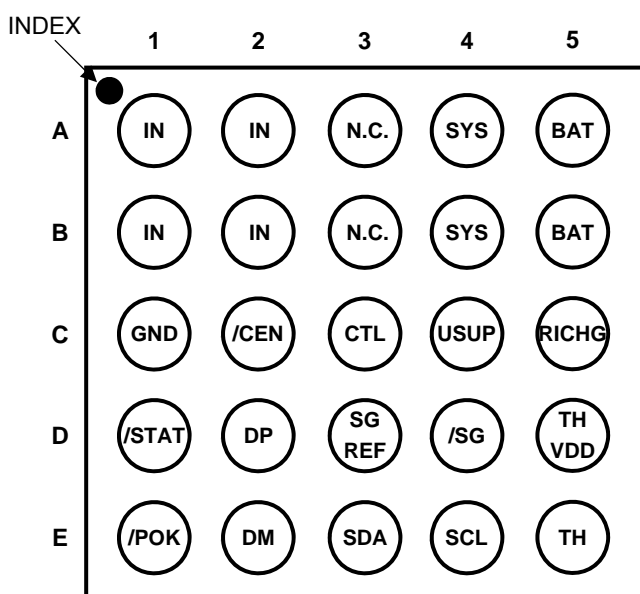

No.	Terminal name	I/O	Function
A1,A2,B1,B2	IN	I	Power input(Each IN terminal must be short-circuited on the board)
A3,B3	N.C.	-	Non connect (keep these terminals open)
A4,B4	SYS	O	System power output (Each SYS terminal must be short-circuited on the board)
A5,B5	BAT	I/O	Battery connection terminal (Each BAT terminal must be short-circuited on the board)
C1	GND	GND	Ground
C2	/CEN	I	Charge enable
C3	CTL	I	Input current limitation terminal
C4	USUP	I	Suspend terminal
C5	RICHG	O	Resistor connection terminal for setting charge current
D1	/STAT	O	Charge State output (During charge:ON, Error : Blinking)
D2	DP	I	USB DP port input
D3	SGREF	I	Reference voltage input terminal for /SG control voltage
D4	/SG	O	Gate control terminal for system Load SW
D5	THVDD	O	Regulated voltage output for the thermistor (2.0V)
E1	/POK	O	Input power OK output(Open Drain)
E2	DM	I	USB DM port input
E3	SDA	I/O	Serial data input/output
E4	SCL	I	Serial clock input
E5	TH	I	Thermistor input

/CEN	Charge function
Lo	Enable
Hi	Disable

USUP	Suspend
Lo	Disable
Hi	Enable

CTL	SDP input current limit
Lo	100mA
Hi	500mA

### Charge state diagram

- Notes**
- 1)    : Judged after 256ms delay time for preventing erroneous detection. (Others are judged instantly)
  - 2) When  $V_{BAT} > V_{SYS}$  (MOSFET between BAT and SYS : ON), the state is not changed except for battery voltage error or chip temperature error.
  - 3) There are 3 operations of timer in each transition for Trickle charge timer and Quick charge timer.
    - 'RESET TIMER'
    - 'HOLD TIMER'
    - 'RESTART TIMER'
  - 4) The release conditions against 'Error 1' are as follows:
    - $V_{IN}$  not detected [ $POK='H'$ ]
    - Suspend
    - Charge stop [ $CEN='H'$ ]
    - Battery non-connection

- \*1 State transition judgment includes battery temperature detection. State is kept in Default(00H) when TH temperature protection (High or Low) and thermistor open.
- \*2 It's 'or' condition with  $T_{THM} < T_{THCON}$  when  $THBATCON='1'$  (set by I2C).
- \*3 It's 'or' condition with  $T_{THM} > T_{THCON}$  when  $THBATCON='1'$  (set by I2C).
- \*4 These judgment times are 384ms for these transitions.
- \*5 Refer to Input voltage detection about the condition of  $POK='L'$  or 'H'.

Charge control Compliant with JEITA guideline

**Charge state diagram**

**Note:**

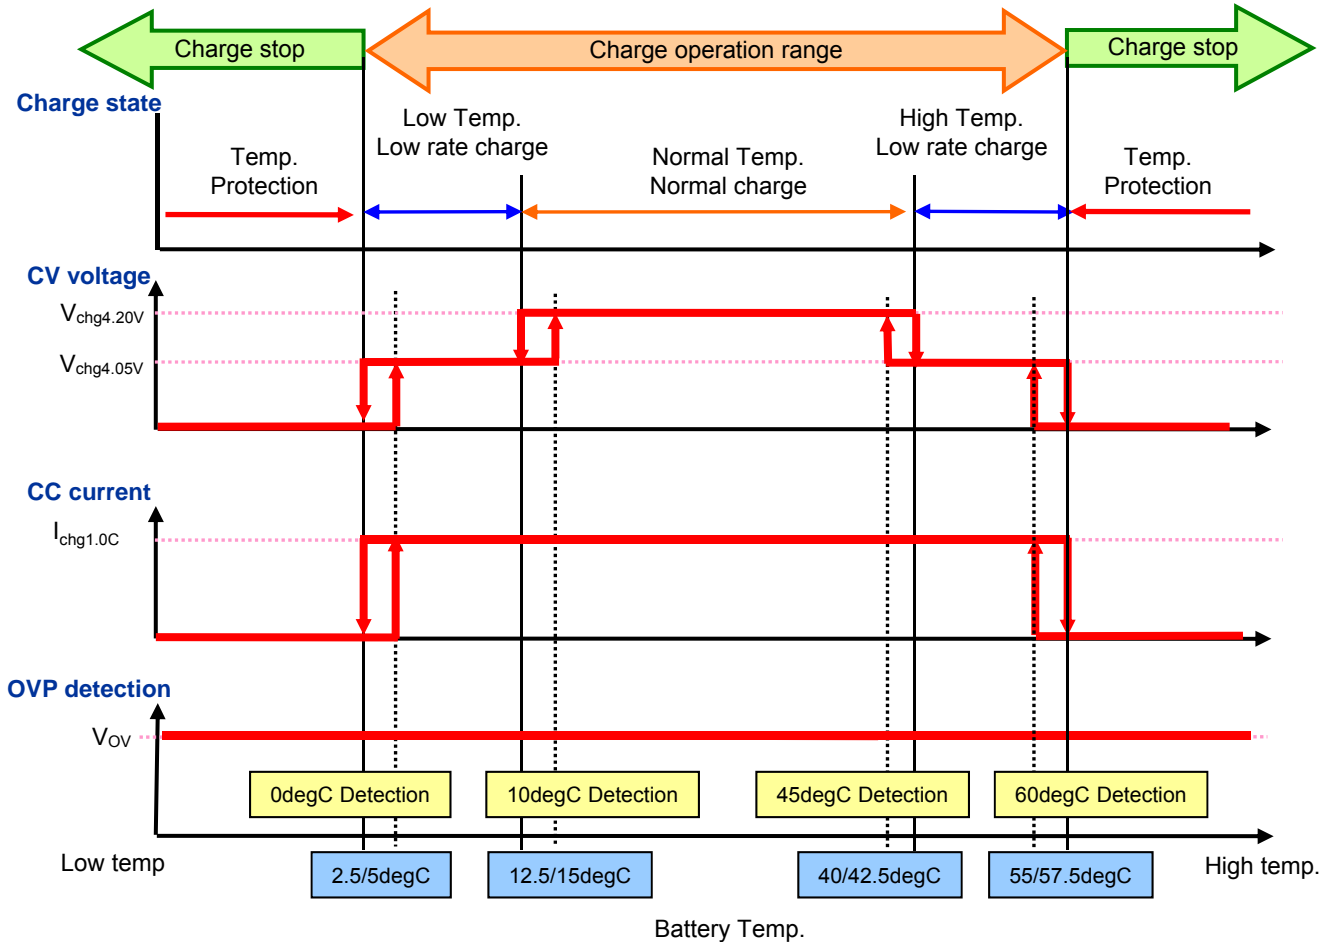

\* During quick charge, junction temperature is monitored to limit charge current value between 0.2C-1.0C so that the junction temperature may not exceed  $T_{reg}$ .

\* The High temp. charge-1 (04H) is operating at  $T_a=85 degC$  in above waveform.

**Function description**

**Battery temperature detection**

This IC detects battery temperature with thermistor I/F and controls CV voltage according to built-in charge profile.

There is the delay time(64ms x 4times=256ms) for preventing erroneous detection before judging the battery temperature.

*Control Diagram corresponding JEITA Guideline*

When PSE control (ADR=02H) is 'Enable' setting, the charge control voltage changes as the above chart according to JEITA guide line. But when VCHG setting (ADR=00H) is 4.00V, the charge control voltage at low rate charge is also 4.00V not 4.05V.

When PSE control (ADR=02H) is 'Disable' setting, the charge control voltage depends on the VCHG setting (ADR=00H).

When THBATCON (ADR=02H) is 'Enable' setting, the battery connection is detected with battery voltage or TH voltage. For details, please refer to 'Battery connection detection'.

When thermistor is not used, please connect TH terminal with THVDD terminal and set 'PSE control (ADR=02H)' to 'Disable'.

**Resistor value for thermistor**

TEMP. (deg.C)	R(KΩ)
2.5	311.6
5.0	272.5
12.5	184.5
15.0	162.7

TEMP. (deg.C)	R(KΩ)
40.0	50.7
42.5	45.5
55.0	27.1
57.5	24.5

\*: NCP15WF104F03RC (Murata)

**Function description**

6 types of USB port detection are enabled by detecting DP and DM terminals and the current limit is automatically set for each port. This detection starts after applying the voltage above  $V_{ULVO}$  (TYP. 3.3V) to IN terminal or sending reset signal by RST\_USBDET (ADR:02H).

No.	Port	USB battery charging 1.2	Current limit (mA)
1	SDP (Standard Downstream Port)	O	100 or 500*1
2	CDP (Charging Downstream Port)	O	1500
3	DCP (Dedicated Charging Port)	O	1500
4	VBUS Divided Port 1	-	500
5	VBUS Divided Port 2	-	1000
6	VBUS Divided Port 3	-	1800

\*1 It depends on CTL terminal setting

CTL	SDP current limit
Lo	100mA
Hi	500mA

The detection result is stored in the registers.

When DP and DM terminals are open, this IC regards the port as SDP and indicates '1' in 'TOUT\_DCD' register.

When  $DP > 3.3V$  or  $DM > 3.3V$ , this IC indicates 'ERROR' register and enter the suspend mode. Suspend is can be dissolved by 'RST\_USBDET' or 'USBMD'.

04H USB Detection result (Read only)

Bit5	Bit4	Bit3	USB
0	0	0	SDP (Standard Downstream Port)
0	0	1	CDP (Charging Downstream Port)
0	1	0	DCP (Dedicated Charging Port)
1	0	0	VBUS Divided Port 1
1	0	1	VBUS Divided Port 2
1	1	0	VBUS Divided Port 3
0	1	1	DP ERROR
1	1	1	DM ERROR

For VBUS Divided Port, this IC detects the combination of the divided voltage with 'DP' and 'DM' terminals as the following chart.

Port	DP	DM	Current limit(mA)
VBUS Divided Port 1	2.00V	2.00V	500
VBUS Divided Port 2	2.00V	2.68V	1000
VBUS Divided Port 3	2.68V	2.00V	1800

\* These voltages are the divided voltage at  $V_{IN}=5.0V$ . These voltages also change with  $V_{IN}$  voltage at this dividing ratio.

\* Please set the downside resistance of the divided resistances to be above 100Kohm.

USB detection timing chart

DP and DM terminal become Hi-Z (open) after USB detection.

<b>Function description</b>
-----------------------------

**Dead Battery Provision**

When  $V_{BAT} < V_{syswoff\_set}$  (low battery detection voltage) at the USB detection, the behaviors for each USB port are as follows:

## &lt; SDP ( Standard Downstream Port) &gt;

- SG terminal is 'H'.
- Trickle charge or quick charge can start.
- Dead Battery Provision starts and DP terminal outputs  $V_{DP\_SRC}$  (Typ. 0.6V).
- If  $V_{BAT}$  doesn't exceed  $V_{syswoff}$  in  $T_{wchg}$  (typ. 40min.), it shifts into the suspend mode. Please reconnect with  $V_{IN}$  to resolve this suspend mode.
- It can stop Weak Battery timer to set Timer Control (ADR=01H) to 'RESET' or 'Count Stop'. Setting input current with 'USBMD'='1' can avoid shifting into the suspend mode.
- When  $V_{BAT} > V_{syswon}$  ( $V_{syswoff} + V_{syswoff\_hys}$ ), the USB detection is carried out again. During the USB detection, it shifts into the suspend mode and SYS terminal outputs BAT voltage. The charge function starts from 'Default (00H)' and SG terminal is 'L'. DP and DM terminals becomes Hi-Z (open) after the USB detection. If the battery voltage drops below  $V_{syswoff}$  after this, Dead Battery Provision doesn't start again. /SG is set to 'H' but Weak Battery timer and  $V_{DP\_SRC}$  output from DP terminal don't operate.

## &lt; DCP ( Dedicated charging Port) &gt;

- SG terminal is 'H'.
- Trickle charge or quick charge can start.
- Dead Battery Provision starts and DP terminal outputs  $V_{DP\_SRC}$  (Typ. 0.6V).
- Weak Battery timer (Typ. 40 min) doesn't count up. But the each charging timer (trickle or quick charge timer) counts up.
- When  $V_{BAT} > V_{syswon}$  ( $V_{syswoff} + V_{syswoff\_hys}$ ), the USB detection is carried out again. During USB detection, it shifts into the suspend mode and SYS terminal outputs BAT voltage. The charge function starts from 'Default (00H)' and SG terminal is 'L'. DP and DM terminals becomes Hi-Z (open) after the USB detection. If the battery voltage drops below  $V_{syswoff}$  after this, Dead Battery Provision doesn't start again. /SG is set to 'H' but  $V_{DP\_SRC}$  output from DP terminal doesn't operate.

## &lt; CDP ( Charging Downstream Port) &gt;

- the operation is the same as DCP. But during Dead Battery Provision mode, this port is detected as 'DCP' and USB detection register (ADR=04H) also indicates 'DCP'.

## &lt; Divided port 1,2,3&gt;

- There isn't Dead Battery Provision for Divided port. USB detection after good battery detection doesn't start.
- SG terminal is 'H'.

Connecting IN terminal when BAT is open is regarded as 'Weak Battery' and Dead Battery Provision starts. If Dead Battery Provision continues in  $T_{wchg}$ , it shifts into the suspend mode. For avoiding shifting into the suspend mode, set timer control (ADR=01H) to 'RESER' or 'Count STOP'.

**Function description**

**SGREF terminal setup**

The low battery detection voltage ( $V_{\text{syswoff}}$ ) is used for the following functions.  
 - Detection weak battery after 'Forced charge (01H)'  
 - On/off function for MOSFET for System load SW'

SGREF terminal voltage ( $V_{\text{SGREF}}$ ) can set the low battery detection voltage( $V_{\text{syswoff}}$ ).

[ SGREF detection voltage (Typ. 1.8V) <  $V_{\text{SGREF}}$  ]

- The internal setting is selected.  
 $V_{\text{syswoff}} = V_{\text{syswoff\_in}}$  (Typ. 3.4V) , Hysteresis voltage =  $V_{\text{sysw\_in\_hys}}$  (Typ. 100mV)  
 We recommend that SGREF is connected with THVDD when using the internal setting.

[  $\text{GND} < V_{\text{SGREF}} < \text{SGREF detection voltage (Typ. 1.8V)}$  ]

- $V_{\text{syswoff}} = V_{\text{syswoff\_out}}$   
 Relational expressions are as follows:  
 $V_{\text{SGREF}} = 0.354 \times V_{\text{syswoff\_out}}$   
 $V_{\text{sysw\_out\_hys}} = 200\text{mV} \times V_{\text{syswoff\_out}} / 3.4\text{V}$

\* Input 0.3V to SGREF if the low battery detection function is not used.  
 It is possible to divide THVDD voltage with upper 51KΩ and lower 9.1KΩ resistances .

**Gate control for system Load SW (/SG)**

This function controls '/SG' terminal.  
 '/SG' terminal is connected with the LoadSW (recommended Renesas HAT1069C) between The SYS terminal and SYSTEM, and controls power supply to SYSTEM ON/OFF.  
 And '/SG' terminal can be used for the control of an USB SW because this terminal becomes 'H' (OFF) during the USB detection.

1. '/SG' = 'H' ('OFF') during the USB detection or Dead Battery Provision. 'H' voltage during the USB detection can become the BAT voltage. Refer to 'Starting function after IN connected'.
2. This function can be selected for 'Enable' or 'Disable' by SGCTL (ADR=02H).
3. When the battery voltage is low, all current can be used for charging by stopping the current supply for SYSTEM with the LoadSW off. (After USB detection & SGCTL: Enable)

[/SG control in each condition about the IN and the BAT ( Except for the USB detection, Dead Battery Provision and SGCTL: Disable)]

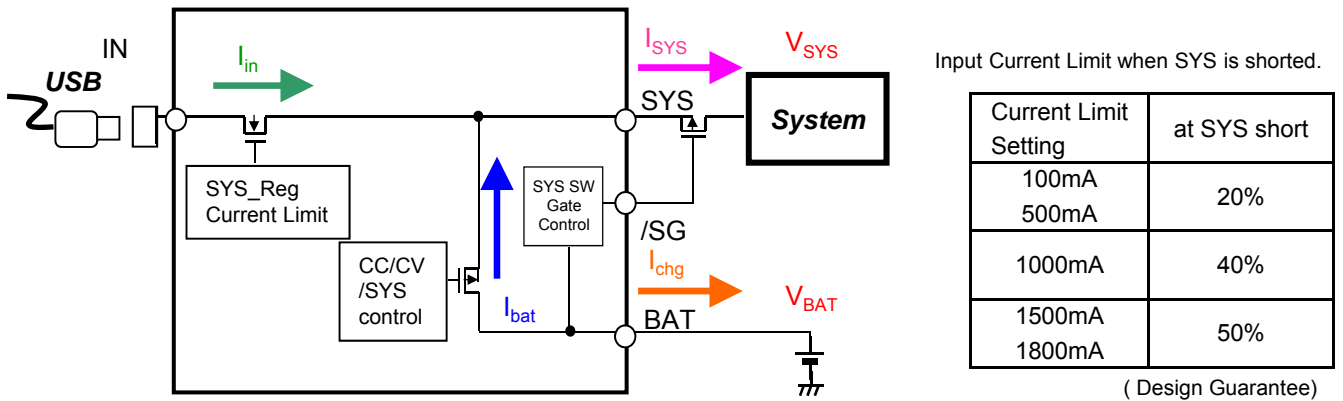

- |  |   |                                |

**Function description**

**Input current limitation / Control between SYS and BAT**

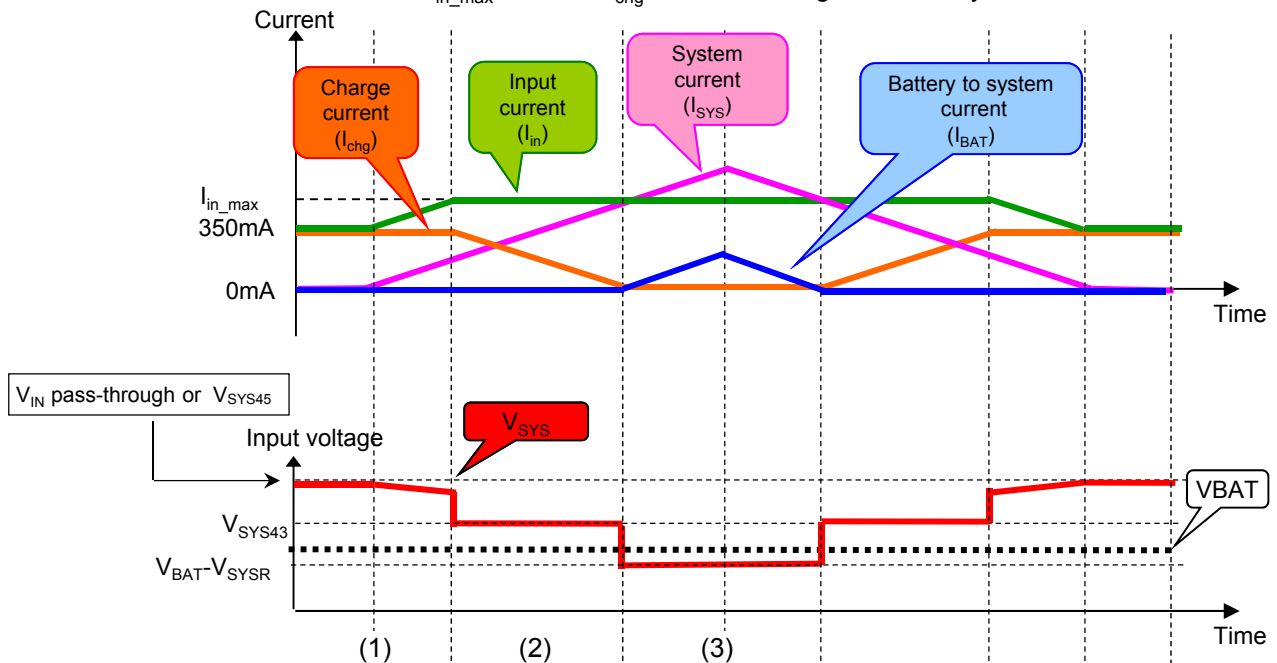

- USB detection (USB battery charging 1.2)
- Input current limitation(100mA/500mA/1000mA/1500mA/1800mA/limitless/Suspend) can be set by I2C.
- The current limit is dropped as the list for protection when SYS is shorted.
- When the total sum of the charge current and the system current is below the input limit current, SYS terminal outputs IN voltage directly. When IN voltage is over 5.4V, SYS voltage is controlled to be below 5.4V.  
Capable for switching between  $V_{SYS45}$  and  $V_{IN}$  pass-through by I2C.
- IC switches the system power supply and the battery charge seamlessly within input current limitation.

**Auto load current distribution control**

Example of power control between the system supply and the battery charge

Conditions : IN=5.0V is connected,  $I_{in\_max}=500mA$ ,  $I_{chg}=350mA$ , Chargeable battery is connected.

- (1) The IC charges the battery at  $I_{chg}=350mA$  and supplies the system current( $I_{SYS}$ ) within  $I_{in\_max}=500mA$ .
- (2) When the system current( $I_{SYS}$ ) increases and the total sum of  $I_{SYS}$  and  $I_{chg}$  reaches  $I_{in\_max}$ , the IC reduces the charge current.
- (3) When the system current ( $I_{SYS}$ ) increases more and  $I_{SYS}$  exceeds  $I_{in\_max}$ ,  $V_{SYS}$  falls to  $V_{BAT}-V_{SYSR}$  and the battery supplies the load current to system through the Path SW. (IC attempts to sustain the system voltage no matter what causes it to drop.)

**Function description**

**Over load detection**

When IN voltage drops below  $V_{HL}$ , the input current is controlled as the current at the time regardless of the current limit setting. The OVERLOAD register (ADR:03H Bit0) indicate '1'.

This IC detects lack of current capability of power supply and prevents exceeded current from flowing from IN terminal.

**Input voltage detection**

$V_{UVLO} \leq V_{IN} \leq V_{OVP}$  and  $V_{IN} \geq V_{BAT} + V_{inBat}$  : Power supply from IN to SYS and charging are available. /POK =L.

$V_{OVP} \leq V_{IN}$  or the suspend mode : Power supply from IN to SYS and charging are not available. /POK=H.

- The suspend mode is shifted at the following situation:
- USUP : 'H' - I2C setting (CTL3) - USB detection
  - Weak Battery Timer : Time out
  - DP ERROR or DM ERROR (After USB detection)
  - USB detection reset (RST\_USBDET : Enable)

<b>Function description</b>
-----------------------------

**Battery connection detection**

THBATCON : 'Disable'

connection sequence	Battery condition	Thermistor		
		Included in battery *1	on board *2	No use *3
BAT -> IN	Normal	Starting from Default(00H)	Starting from Default(00H)	Starting from Default(00H)
	Open Battery	Starting from Default(00H)	Starting from Default(00H)	Starting from Default(00H)
IN -> BAT *4	Normal	Starting from Default(00H)	Forbidden	
	Open Battery	Default(00H)		

THBATCON : 'Enable'

connection sequence	Battery condition	Thermistor		
		Included in battery *1	On board	No use
BAT -> IN	Normal	Starting from Default(00H)	Forbidden	
	Open Battery	Starting from Default(00H)		
IN -> BAT *4	Normal	Starting from Default(00H)		
	Open Battery	Starting from Default(00H)		

\*1 : TH voltage is in the charging range.

Charging doesn't start with no battery because TH voltage is not in the charging range.

\*2 : TH voltage is in the charging range.

\*3 : PSE Control : 'Disable'

\*4 : Don't start charging with no battery.

<b>Function description</b>
-----------------------------

Battery connection is detected by battery voltage as follows:

- Battery voltage ( $V_{BAT}$ ) > Charge start voltage ( $V_{start}$ )

When register [ THBATCON (ADR:02H) ] is set to 'Enable', Battery connection is detected by battery voltage or TH terminal voltage as follows:

- Battery voltage ( $V_{BAT}$ ) > Charge start voltage ( $V_{start}$ )
- TH terminal voltage < Thermistor connection detect voltage ( $V_{THCON}$ )

When thermistor is included in battery pack and this register is set to 'Enable', charging can also start for an open battery.

When thermistor isn't included in battery pack, please don't set this register 'Enable'.

The list in the previous page shows the behavior with 3 kinds of thermistor setting and 2 kinds of battery.

- <Thermistor> 'Included in battery', 'On board', 'No use'
- <Battery> 'Normal', 'Open battery'

When THBATCON(ADR:02H) is 'Disable' setting (Default setting), the battery connection is detected by only battery voltage.

When IN is connected after 'battery connection', charging starts from 'Default (00H)' state for both 'Normal' and 'Open battery'.

When IN is connected before 'battery connection', charging starts for 'Normal' battery as same as when IN is connected after 'battery connection'. For 'Open battery', the state stays at 'default(00H)' because it can't detect battery connection. And charging is forbidden with no battery when thermistor is 'On board' or 'No use'.

If THBATCON (ADR:02H) is set to 'Enable', battery connection is detected by either battery voltage or TH terminal voltage. Charging also starts for 'Open battery' as same as 'Normal'. So it is possible to charge for all batteries when thermistor is 'Included in battery'.

When thermistor is 'On board' or 'No use', THBATCON (ADR:02H) 'Enable' setting is forbidden. And please don't charge with no battery.

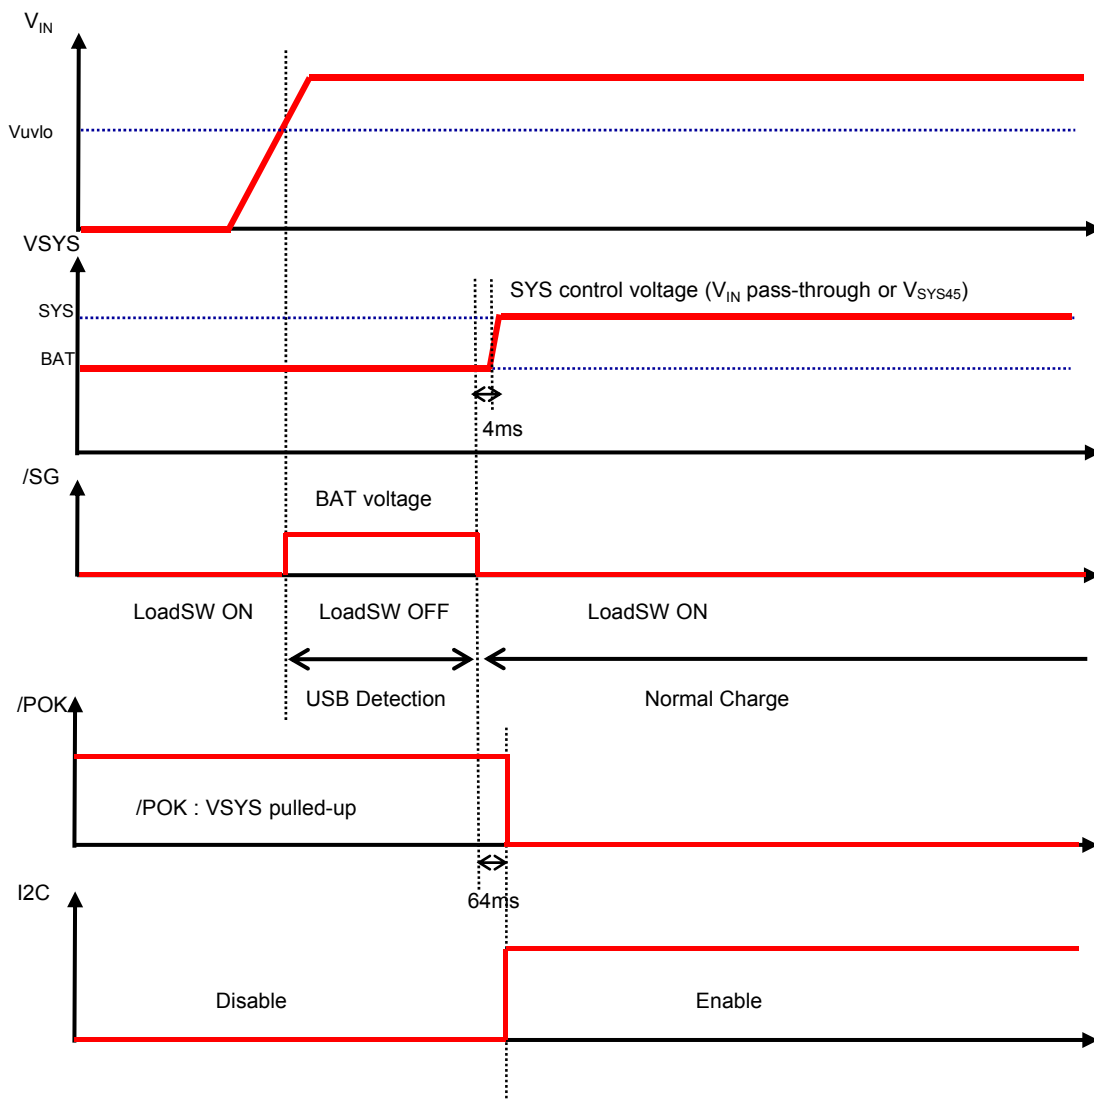

**Function description**

Starting function after IN connected

We show starting function for each battery and USB port.

- (1) USB detection with Good Battery ( $V_{BAT} > V_{SYSSWOFF}$ ) after IN connected
- (2) USB detection with Weak Battery ( $V_{BAT} < V_{SYSSWOFF}$ ) after IN connected  
[Battery Charging 1.2 Port]
- (3) USB detection with Weak Battery after IN connected [Divided Port]
- (4) USB detection with no Battery after IN connected [Battery Charging 1.2 Port]
- (5) USB detection with no Battery after IN connected [Divided Port]

(1) USB detection with Good Battery ( $V_{BAT} > V_{SYSSWOFF}$ ) after IN connected

**Function description**

(2) USB detection with Weak Battery ( $V_{BAT} < V_{SYSSWOFF}$ ) after IN connected

[Battery Charging 1.2 Port]

\* Weak battery timer operates during Dead Battery Provision at SDP.  
 If the battery voltage doesn't exceed  $V_{syswoff}$  in  $T_{wchg}$  (typ. 40min.), it shifts into the suspend mode.  
 (Refer to 'Dead Battery Provision'.)

Function description

(3) USB detection with Weak Battery ( $V_{BAT} < V_{SYSSWOFF}$ ) after IN connected

[Divided Port]

Function description

(4) USB detection with no Battery after IN connected

[Battery Charging 1.2 Port]

- \* Weak battery timer operates during Dead Battery Provision at SDP. If the battery voltage doesn't exceed  $V_{syswoff}$  in  $T_{wchg}$  (typ. 40min.), it shifts into the suspend mode. (Refer to 'Dead Battery Provision'.)
- \* Dead Battery Provision lasts when a weak battery is connected. USB re-detection starts when the battery becomes a good battery.
- \* Please start charging after connecting a battery. Don't start charging with no battery.

Function description

(5) USB detection with no Battery after IN connected

[Divided Port]

\* /SG doesn't change when a weak battery is connected.  
 /SG becomes 'L' after the battery becomes a good battery.

\* Please start charging after connecting a battery. Don't start charging with no battery.

<b>Function description</b>
-----------------------------

**Forced charge**

After input power detection, forced charge starts for canceling the cutoff state of battery due to over-discharge. The forced charged current is the same as trickle charge current setting. Register (ADR=00H Bit6) is available for changing setting.

Charging starts even with an open battery by this function.

Please refer to [Battery connection detection](#).

**Timing from input detection to charge start****Trickle charge (0.1C constant current charge)**

After input detection and battery detection, trickle charge starts when  $V_{BAT} < V_{qcchg\ on}$  (Typ. 3.0V).

- When detecting  $V_{BAT} \geq V_{qcchg\ on}$ , the state shifts to quick charge mode.
- Trickle charge timer starts when trickle charge starts.
- After trickle charge timer expires, the state shifts to 'error mode 1' if  $V_{BAT} < V_{qcchg\ on}$ . However trickle timer stops when the battery voltage becomes below  $V_{start}$ . When BAT is shorted, this timer also stops. NOBAT(ADR=03H, Bit5) indicates detecting the battery voltage below  $V_{start}$ . After NOBAT='1' by detecting  $V_{BAT} \leq V_{start}$ , please stop charging with /CEN.
- When detecting  $V_{BAT} \geq V_{ov}$  (Typ. 4.35V), the state shifts to 'error mode 1'.

Trickle charge setting is selectable between 0.1C and 0.2C by register (ADR=00H Bit4,5).

**Quick charge (1.0C constant current charge)**

Quick charge starts after detecting  $V_{BAT} \geq V_{qcchg\ on}$ .

- When detecting  $V_{BAT} = V_{chg}$ , the state shifts to CV (constant voltage) charge mode.
- Quick charge timer starts when quick charge starts.
- When detecting  $V_{BAT} < (V_{chg\ on} - \text{hysteresis voltage})$  (Typ. 2.9V), the state shifts to trickle charge mode.
- When detecting  $V_{BAT} \geq V_{ov}$  (Typ. 4.35V), the state shifts to 'error mode 1'.

During quick charge, this IC monitors junction temperature and controls the current between 0.2C and 1.0C not to exceed  $T_{reg}$ .

The quick charge current is selectable between 0.5C and 1.0C by register (ADR=00H Bit 0).

**Function description**

**Timing to Quick charge(1.0C)**

**Constant voltage charge**

- When detecting  $V_{BAT}$ =Charge Control voltage during quick charge mode, constant voltage charge starts.
- When the charge current falls below charge completion current during constant voltage charge, the state shifts to charge completion detection mode. If  $V_{BAT} \geq V_{rechg}$  (Typ. 3.8V), the state shifts to charge completion state.
  - When  $V_{start} \leq V_{BAT} < V_{rechg}$ , the state shifts to 'error mode 1'.
  - When  $V_{BAT} < V_{start}$ , the state shifts to Battery non-connection mode.
  - The current (about 200 $\mu$ A) is discharged from BAT terminal during the charge completion detection mode. After this state, the next state is selected among Charge completion, Battery non-connection or Error-1 by the battery voltage.
  - The charge control voltage is selectable from 4.00V to 4.20V (50mV steps) by register (ADR=00H Bit 1,2,3).

**Timing of charge completion detection**

**Function description**

**Recharge function**

After charge completion, battery voltage continues to be monitored.  
 When  $V_{BAT} < V_{rechg}$ , recharge starts.  
 Quick charge timer also starts to operate when recharge starts.

**Timing of recharge judgment**

**LED control (/STAT)**

## Function description

### Charge Current Setting

Charge Current is set by the external resistance with RICHG terminal.  
Here is the formula between R<sub>ICHG</sub> and I<sub>chg1.0C</sub>.

$$R_{ICHG} = 812 \times I_{chg1.0C}^{-0.9}$$

R<sub>ICHG</sub> (Kohm) : External Resistance with RICHG  
I<sub>chg1.0C</sub> (mA) : Quick charge setting

0.2C, 0.1C and 0.05C are 20%, 10% and 5% current of 1.0C.  
They can be set by register (ADR=00H).

The accuracy of each current is as the following list.  
Please use the current over 5mA.

### Accuracy of each setting about charge current and charge completion current

Item	Quick Charge Current(I <sub>chg1.0C</sub> ) Setting		
	500mA ≤ I <sub>chg1.0C</sub>	I <sub>chg1.0C</sub> = 500mA	50mA ≤ I <sub>chg1.0C</sub> < 500mA
I <sub>chg1.0C</sub>	+-[10+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -10[%]	+-[30+(50mA-I <sub>chg1.0C</sub> )/22.5mA] [%]
I <sub>prechg0.2C</sub>	+-[30+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -30[%]	+-[40+(50mA-I <sub>chg1.0C</sub> )/45mA] [%]
I <sub>prechg0.1C</sub>	+-[30+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -30[%]	+-[40+(50mA-I <sub>chg1.0C</sub> )/45mA] [%]
I <sub>fc0.2C</sub>	+-[30+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -30[%]	+-[50+(50mA-I <sub>chg1.0C</sub> )/22.5mA] [%]
I <sub>fc0.1C</sub>	+-[30+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -30[%]	+-[50+(50mA-I <sub>chg1.0C</sub> )/22.5mA] [%]
I <sub>fc0.05C</sub>	+-[40+(I <sub>chg1.0C</sub> -500mA)/100mA] [%]	+ -40[%]	+-[50+(50mA-I <sub>chg1.0C</sub> )/45mA] [%]

[ Design guarantee except for I<sub>chg</sub>=500mA ]

**Function description**

**Chip temperature detection**

During quick charge, junction temperature is monitored to limit charge current between 0.2C to 1.0C so that junction temperature may not exceed  $T_{treg}$ .

**Thermal shutdown**

When junction temperature reaches  $T_{sd}$  (default: 150degC) under charge, IC stops to supply from IN to SYS and the state moves to error mode.

**Chip temperature detection and Thermal shutdown**

		V <sub>IN</sub> pass-through	1	1	-	-	-	-	-	

\*1) When /CEN=L and /CEN2(register)='0', Charge operation is enable.

[Truth Table]

/CEN	/CEN2	Charge Operation
Lo	0	Charge start
Lo	1	Charge stop
Hi	0	Charge stop
Hi	1	Charge stop

\*2) When USBMD=0, Terminal setting(USUP) is available. When USBMD=1, Register(CTL3) is available and the suspend function by Weak battery timer is unavailable.  
Re-connect with IN when going into the suspend mode by Weak battery timer.

\*3) Slow: 2 times of normal mode(Trickle charge timer=120min., Quick charge timer=600min , Weak battery timer = 80min.)

\*4) Slow: 4 times of normal mode(Trickle charge timer=240min., Quick charge timer=1200min , Weak battery timer = 160min.)

\*5) Count stop : Timer is suspended.(Not reset)

\*6) When RST\_USB=1, the USB detecting is in reset and /SG output is 'L'.  
When RST\_USB=0, the USB detecting will restart.  
During the USB detection, /SG is 'H'.  
After USB detection, /SG output is determined by the SG function.  
USB re-detection by RST\_USBDDET can reset the suspend by USB detecting error.

\*7) The SYS voltage setting can be set by the SYSMODE register.

\* When V<sub>IN</sub><2.0V, the register is reset. (This value is design guarantee).

$t_{SU:STA}$	START condition setup time	0.6	-	$\mu$ s
$t_{HD:DAT}$	Data hold time	0	0.9	$\mu$ s
$t_{SU:DAT}$	Data setup time	100	-	ns
$t_R$	Rise time (SDA and SCL)	-	300	ns
$t_F$	Fall time (SDA and SCL)	-	300	ns
$t_{SU:STO}$	STOP condition setup time	0.6	-	$\mu$ s
$C_b$	Bus line capacitive load	-	400	pF

Note : Above values are specified by  $V_{IHmin}$  and  $V_{ILmax}$ .

### I<sup>2</sup>C Timing Chart

**Serial communication format**

**1. Start condition**

Set SDA from High to Low when SCL=High.

**2. Slave address**

**3. Stop condition**

Set SDA from Low to High when SCL=High.

**4. Read/Write code**

Write code : SDA=Low  
 Read code : SDA=High

**5. Write mode :Data input from Master to R2A20056**

- R2A20056 will respond with an Acknowledge '0' when;
- Master inputs Slave address (8bit) and Write code after start condition
  - Master inputs Register address (8bit)
  - Master inputs Write data (8bit)
- Lastly, Master will input Stop condition.

**6. Read mode :Data output from R2A20056 to Master**

When Master inputs Slave address(8bit) and Write code after start condition, R2A20056 responds with an Acknowledge'0'. And then, when Master inputs Register address(8bit), R2A20056BM responds with an Acknowledge'0'. And then, when Master inputs Start condition, Slave address, and Read code, R2A20056 responds with an Acknowledge'0' and outputs Read data. Lastly, Master inputs Acknowledge'1'(or opens bus line) and Stop condition.

**Serial communication format**

[ Pull-down resistance with 'SCL' and 'SDA' terminals ]

There are pull-down resistances with 'SCL' and 'SDA' terminals in this IC.

Item	Rated Value			Unit
	Min.	Typ.	Max.	
pull-down Resistance of SCL,SDA	500	700	900	KΩ

Please set the pull-up resistances to satisfy the calculating formula.

- $V_{pup}[V]$  : Pull-up voltage
- $R_{up}[KΩ]$  : Pull-up resistance
- $R_{mos}[KΩ]$  : ON resistance of NMOS in HOST

[ The circuit around SDA, SCL terminals ]

< 'H' voltage >

$$V_H = V_{pup} \times \frac{R_{dwn}}{R_{up} + R_{dwn}}$$

$R_{dwn}$  is affected lightly because of  $R_{up} \ll R_{dwn}$ .

< 'L' voltage >

$$V_L = V_{pup} \times \frac{(R_{mos} // R_{dwn})}{R_{up} + (R_{mos} // R_{dwn})}$$

$R_{dwn}$  is affected lightly because of  $R_{mos} \ll R_{dwn}$ .

[ I2C communication notice ]

If 'L' signal is input to 'SCL' and 'SDA' terminals before normal I2C signal, this IC may not accept this I2C signal because of detecting 'Start condition'.

When the pull-up voltage is turned off during continuing to supply voltage to the IN terminal, the 'L' signal may be miss-detected as the start condition.

Please take measures as follows:

Resending the command in the error

Please resend the command when ACK is not returned normally.

Timing adjust when turning off the pull-up power supply

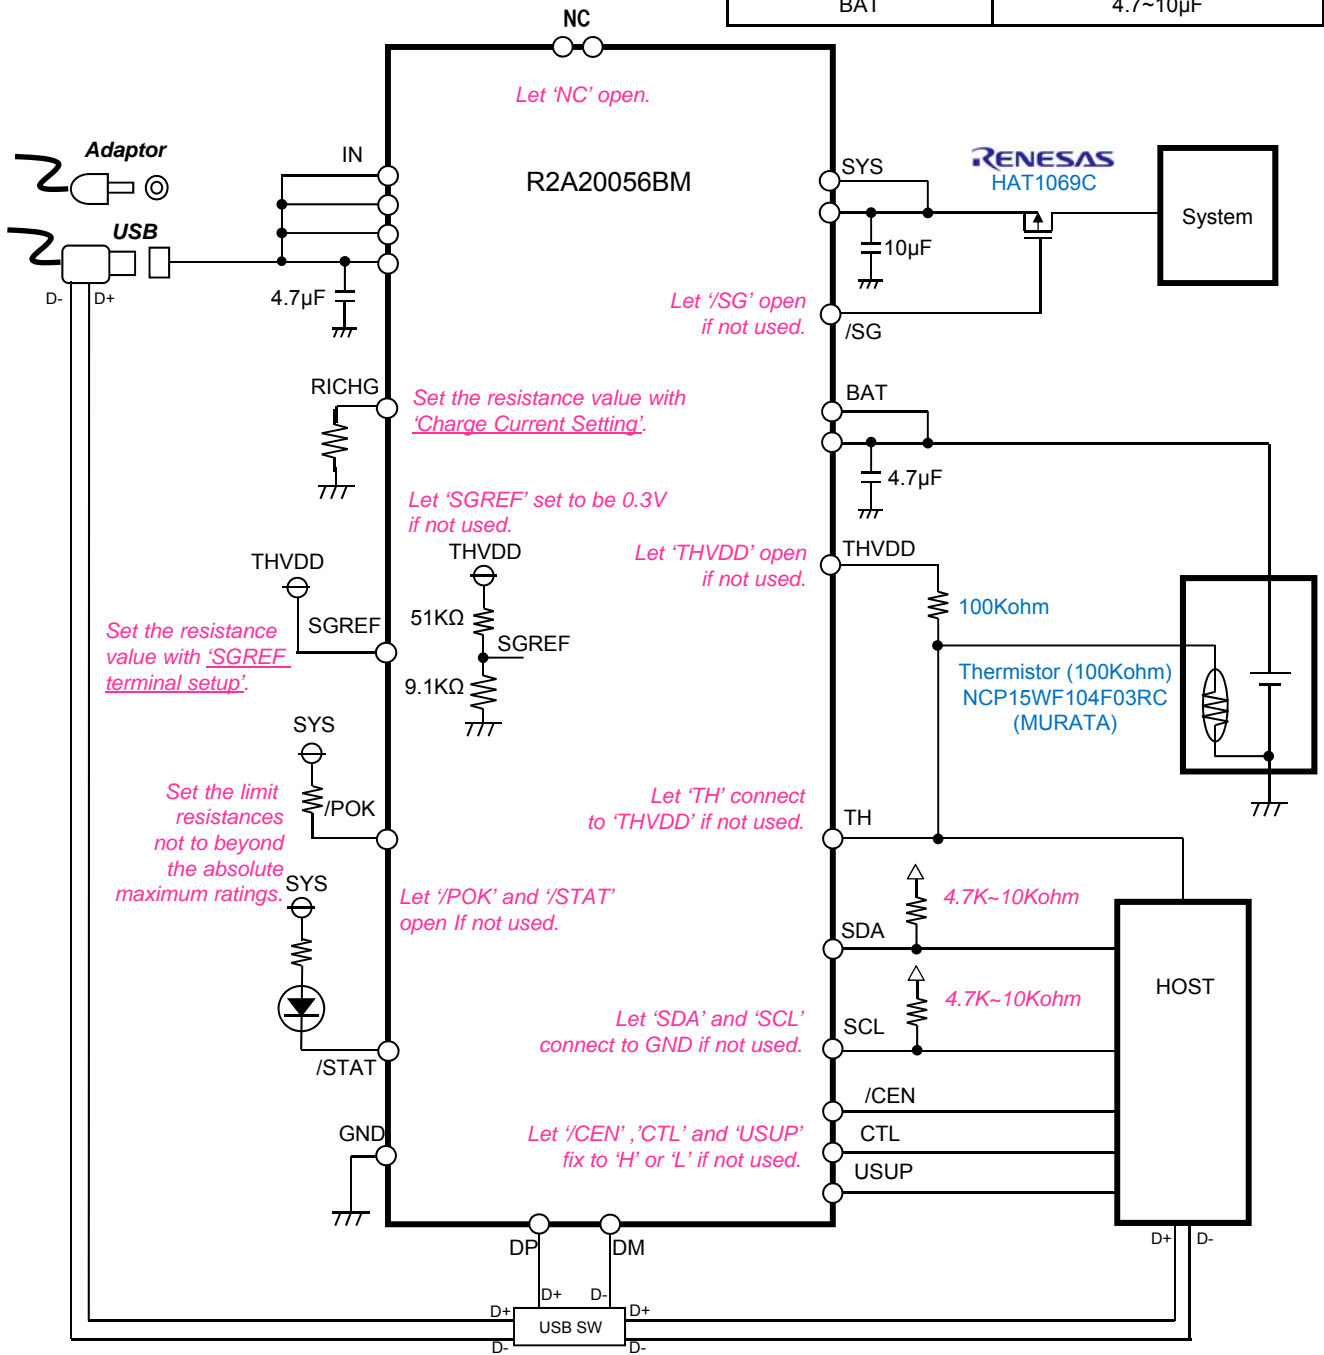

Please make 'SCL' fall faster than 'SDA' when pull-up power is turned off while voltage is supplied to the IN terminal.

The example of NG

**Typical Application Circuit**

Terminal Name	Recommended Capacitance
IN	4.7~10μF
SYS	10μF
BAT	4.7~10μF

Set the resistance value with 'Charge Current Setting'.

Set 'SGREF' set to be 0.3V if not used.

Set the resistance value with 'SGREF terminal setup'.

Set the limit resistances not to beyond the absolute maximum ratings.

Let '/POK' and '/STAT' open if not used.

Let 'TH' connect to 'THVDD' if not used.

Let 'SDA' and 'SCL' connect to GND if not used.

Let '/CEN', 'CTL' and 'USUP' fix to 'H' or 'L' if not used.

Port is detected by 'DP' and 'DM' terminals.  
 Set the port setting as the desired current limit value if not used.  
 Usage Example) SDP : 20Kohm pull-down resistance with 'DP' and 'DM'  
 DCP : Connect 'DP' and 'DM' to each other

Please do not connect 'SYS' terminal to GND.

If 'SYS' terminal is connected with GND in battery connection mode, large currents flow from 'BAT' to 'SYS' through the body diode in MOS-FET between BAT and SYS. If large current continues to flow, it causes power dissipation in the IC to increase. The IC will then heat up and may damage the IC. The heat may also cause the IC to burn.

If the battery completion is detected at 'FULMD'='1' (ADR=02H Bit=2), 'FULL' (ADR=03H Bit=4) becomes '1' but charging continues. Timer also continues after 'FULL' becomes '1'. So charging stops after quick charge timer ends even at 'FULMD'='1'. Timer can be stopped by 'COUNT STOP' (ADR=01H Bit 4~6).

Trickle timer stops when the battery voltage is below  $V_{start}$ . When BAT is shorted, this timer also stops. NOBAT (ADR=03H, Bit5) indicates detecting the battery voltage below  $V_{start}$ . After NOBAT='1' by detecting  $V_{BAT} \leq V_{start}$ , please stop charging with /CEN.

Please do not apply voltage and current exceeding the absolute maximum ratings. It may damage the IC.

Please use this device within the power dissipation not exceeding the allowable range of this package.

When the charging starts with no battery at low  $V_{IN}$  voltage, it has possibilities for oscillation to occur. Please don't start to charge with no battery.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
  2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
  3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
  5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.  
Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
  6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
  7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
  8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
  10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
  11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
  12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.  
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

### SALES OFFICES

Renesas Electronics Corporation
