## AS1119

## 144-LED Cross-Plexing Driver with 320 mA Charge-Pump

## 1 General Description

The AS1119 is a compact LED driver for 144 (90) single LEDs. The devices can be programmed via an $I^{2} \mathrm{C}$ compatible interface.
The AS1119 offers two blocks driving each 72 LEDs (3 blocks each 30LEDS) with $1 / 9$ (1/6) cycle rate. The required lines to drive all 144 ( 90 ) LEDs are reduced to 18 by using the cross-plexing feature optimizing space on the PCB. Every block driving 72(30) LEDs can be analog dimmed from 1 to 30 mA in 256 steps ( 8 bit).
Additionally each of the 144 (90) LEDs can be dimmed individually with 8 -bit allowing 256 steps of linear dimming. To reduce CPU usage up to 6 frames can be stored with individual time delays between frames to play small animations automatically.
The AS1119 operates from 2.7 V to 5.5 V and includes a 320 mA charge-pump to drive also white LEDs. The charge-pump operates in $2: 3$ and $1: 2$ mode.
The AS1119 features very low shutdown and operational current.
The device is available in a ultrasmall 36 -pin WL-CSP.

## 2 Key Features

- $1 \mathrm{MHz} \mathrm{I}^{2} \mathrm{C}$-Compatible Interface
- Open and Shorted LED Error Detection
- 144 LEDs in Dot Matrix
- Low-Power Shutdown Current
- Individual 8-bit LED PWM Control
- 8-bit Analog Brightness Control
- (1:1), 2:3, 1:2 320mA Charge Pump
- 6 Frames Memory for Animations
- System-clk synchronisation for multiple devices
- Supply Voltage Range: 2.7 V to 5.5 V
- Minimum PCB space required
- 36-pin WL-CSP package

## 3 Applications

The AS1119 is ideal for dot matrix displays in mobile phones, personal electronic and toys.

## Pin Descriptions

Table 1. Pin Descriptions

| Pin Name | Pin Number | Description |
| :---: | :---: | :---: |
| $\begin{gathered} \hline \text { VDD1, VDD2, } \\ \text { VDD3 } \end{gathered}$ | A6, E5, E1 | Positive Supply Voltage. Connect to a +2.7 V to +5.5 V supply. Bypass this pin with $10 \mu \mathrm{~F}$ capacitance to GND1, GND2, GND3. |
| VCP | F1 | Charge-Pump Output Voltage. Connect a $2.2 \mu \mathrm{~F}$ capacitor to GND3. |
| C1-, C1+ | B1, C1 | Flying Cap 1. Connect a $1 \mu \mathrm{~F}$ capacitor. |
| C2-, C2+ | A1, D1 | Flying Cap 2. Connect a $1 \mu \mathrm{~F}$ capacitor. |
| GND1 | B5 | Ground for VDD1. Used for CS0-CS8 |
| GND2 | F5 | Ground for VDD2. Used for CS9-CS17 |
| GND3 | A2 | Ground for VDD3. Used for Charge-Pump |
| SDA | C6 | Serial-Data I/O. Open drain digital I/O $\mathrm{I}^{2} \mathrm{C}$ data pin. |
| SCL | D6 | Serial-Clock Input. |
| ADO | C5 | $1^{2} \mathrm{C}$ Address for bit 0. Put to GND or VDD to set ${ }^{2} \mathrm{C}$ addresses. |
| AD1 | D5 | $1^{2} \mathrm{C}$ Address for bit 1. Put to GND or VDD to set ${ }^{12} \mathrm{C}$ addresses. |
| RSTN | F6 | Reset Input. Pull this pin to logic low to reset all control registers (set to default values) and to put the device into power-down. For normal operation pull this pin to VDD. |
| SYNC IN, SYNC_OUT | B6 | Synchronization Clock Input or Output |
| IRQ | E6 | Interrupt Request. Open drain digital Output. |

Table 1. Pin Descriptions

| Pin Name | Pin Number |  | Description |
| :---: | :---: | :---: | :---: |
| CS0 - CS8 | $\begin{gathered} \text { A5-A3, B4-B2, } \\ \text { C4-C2 } \end{gathered}$ | $\begin{aligned} & y \\ & \text { y } \\ & \text { 京 } \\ & \sum_{N}^{n} \end{aligned}$ | Sinks and Sources for 72 LEDs each matrix. |
| CS9-CS17 | $\begin{gathered} \hline \text { D4-D2, E4-E2, } \\ \text { F4-F2 } \end{gathered}$ |  |  |
| CS0-CS5 | A5-A3, B4-B2 |  | Sinks and Sources for 30 LEDs each matrix. |
| CS6-CS11 | C4-C2, D4-D2 |  |  |
| CS12-CS17 | E4-E2, F4-F2 |  |  |

## 5 Absolute Maximum Ratings

Stresses beyond those listed in Table 2 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Section 6 Electrical Characteristics on page 5 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

| Parameter | Min | Max | Units | Comments |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Electrical Parameters | -0.3 | 7 | V |  |  |  |
| VDD to GND | -0.3 | 7 or <br> VDD +0.3 | V |  |  |  |
| All other pins to GND |  | 500 | mA |  |  |  |
| Sink Current |  | 100 | mA |  |  |  |
| Segment Current | -100 | 100 | mA |  |  |  |
| Input Current (latch-up immunity) |  |  |  |  |  |  |
| Electrostatic Discharge |  |  |  |  |  |  |
| Electrostatic Discharge HBM | 1.5 | kV | Norm: JEDEC 78 |  |  |  |

## 6 Electrical Characteristics

VDD $=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~T}_{\mathrm{AMB}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$, typ. values are at $\mathrm{TAMB}=+25^{\circ} \mathrm{C}$ (unless otherwise specified).
Table 3. Electrical Characteristics

|  | Short Detection Level Threshold |  |  | 0.9 | 1.2 | V |
|  | Capacitive Load for Each Bus Line | SCL Frequency $=400 \mathrm{kHz}$ |  |  | 400 | pF |
|  |  | SCL Frequency $=1000 \mathrm{kHz}$ |  |  | 100 |  |

Table 5. ${ }^{2}$ C Timing Characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| fSCL | SCL Frequency |  | 100 |  | 1000 | kHz |
| tBUF | Bus Free Time Between STOP and START Conditions |  | 1.3 |  |  | $\mu \mathrm{l}$ |
| tHoLDSTART | Hold Time for Repeated <br> START Condition |  | 160 |  |  | ns |
| tLow | SCL Low Period |  | 50 |  | 75 | ns |
| tHIGH | SCL High Period |  | 50 |  | 75 | ns |
| tSETUPSTART | Setup Time for Repeated <br> START Condition |  | 100 |  |  | ns |
| tSETUPDATA | Data Setup Time |  | 10 |  |  | ns |
| thoLDDATA | Data Hold Time |  | 10 |  | 70 | ns |
| tRISE(SCL) | SCL Rise Time |  | 10 | 40 | ns |  |
| tRISE(SCL1) | SCL Rise Time after Repeated START Condition and After <br> an ACK Bit |  | 20 | 80 | ns |  |
| tFALL(SCL) | SCL Fall Time |  | 20 |  | 80 | ns |
| tRISE(SDA) | SDA Rise Time |  | 160 |  |  | ns |
| tFALL(SDA) | SDA Fall Time |  |  | 50 |  | ns |
| tSETUPSTOP | STOP Condition Setup Time |  |  | 80 | ns |  |
| tSPIKESUP | Pulse Width of Spike Suppressed |  |  |  |  |  |

## Notes:

1. The Min / Max values of the Timing Characteristics are guaranteed by design.
2. All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

## 8 Detailed Description

## Block Diagram

Figure 13. AS1119-Block Diagram

## $I^{2} \mathrm{C}$ Interface

The AS1119 supports the $\mathrm{I}^{2} \mathrm{C}$ serial bus and data transmission protocol in fast mode at 1 MHz . The AS1119 operates as a slave on the $\mathrm{I}^{2} \mathrm{C}$ bus. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions. Connections to the bus are made via the open-drain I/O pins SCL and SDA.

Figure 14. ${ }^{2} \mathrm{C}$ Interface Initialisation

Figure 15. Bus Protocol

The bus protocol (as shown in Figure 15) is defined as:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH will be interpreted as control signals.

The bus conditions are defined as:

- Bus Not Busy. Data and clock lines remain HIGH.
- Start Data Transfer. A change in the state of the data line, from HIGH to LOW, while the clock is HIGH, defines a START condition.
- Stop Data Transfer. A change in the state of the data line, from LOW to HIGH, while the clock line is HIGH, defines the STOP condition.
- Data Valid. The state of the data line represents valid data, when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal. There is one clock pulse per bit of data.
Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions is not limited and is determined by the master device. The information is transferred byte-wise and each receiver acknowledges with a ninth-bit. Within the $I^{2} \mathrm{C}$ bus specifications a high-speed mode ( 3.4 MHz clock rate) is defined.

Acknowledge: Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit. A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Of course, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an
acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line HIGH to enable the master to generate the STOP condition.

- Figure 15 on page 10 details how data transfer is accomplished on the $I^{2} \mathrm{C}$ bus. Depending upon the state of the R/W bit, two types of data transfer are possible:
- Master Transmitter to Slave Receiver. The first byte transmitted by the master is the slave address, followed by a number of data bytes. The slave returns an acknowledge bit after the slave address and each received byte.
- Slave Transmitter to Master Receiver. The first byte, the slave address, is transmitted by the master. The slave then returns an acknowledge bit. Next, a number of data bytes are transmitted by the slave to the master. The master returns an acknowledge bit after all received bytes other than the last byte. At the end of the last received byte, a not-acknowledge is returned. The master device generates all of the serial clock pulses and the START and STOP conditions. A transfer is ended with a STOP condition or a repeated START condition. Since a repeated START condition is also the beginning of the next serial transfer, the bus will not be released.

The AS1119 can operate in the following slave modes:

- Slave Receiver Mode. Serial data and clock are received through SDA and SCL. After each byte is received, an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit.
- Slave Transmitter Mode. The first byte (the slave address) is received and handled as in the slave receiver mode. However, in this mode the direction bit will indicate that the transfer direction is reversed. Serial data is transmitted on SDA by the AS1119 while the serial clock is input on SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer.

## ${ }^{1}{ }^{2} \mathrm{C}$ Device Address Byte

The address byte (see Figure 16) is the first byte received following the START condition from the master device.
Figure 16. $I^{2} \mathrm{C}$ Device Address Byte

- The bit 1 and bit 2 of the address byte are the device select pins AD0 and AD1, which must be set to VDD or to GND. A maximum of four devices with the same pre-set code can therefore be connected on the same bus at one time.
- The last bit of the address byte $(R / \bar{W})$ define the operation to be performed. When set to a 1 a read operation is selected; when set to a 0 a write operation is selected.
Following the START condition, the AS1119 monitors the $I^{2} \mathrm{C}$ bus, checking the device type identifier being transmitted. Upon receiving the address code, and the $R / \bar{W}$ bit, the slave device outputs an acknowledge signal on the SDA line.

## Command Byte

The AS1119 operation, (see Table 15 on page 21) is determined by a command byte (see Table 17).
Figure 17. Command Byte

Figure 18. Command and Single Data Byte received by AS1119

Figure 19. Setting the Pointer to a Address Register to select a Data Register for a Read Operation

Figure 20. Reading n Bytes from AS1119

## Initial Power-Up

On initial power-up, the AS1119 registers are reset to their default values, the display is blanked, and the device goes into shutdown mode. At this time, all registers should be programmed for normal operation.

Note: The default settings enable only scanning of one digit; the internal decoder is disabled and the Intensity Control Register (see page 16 ) and (see page 20 ) is set to the minimum values.

## Shutdown Mode

The AS1119 device features two different shutdown modes. A software shutdown via shutdown register (see Shutdown Register (0x0A) on page 26) and a hardware shutdown via the RSTN pin.
The software shutdown disables all LED's and stops the internal operation of the logic. A shutdown mode via the RSTN pin additionally powers down the power-on-reset (PO) of the device. In this shutdown mode the AS1119 consumes only 100nA (typ.).

## 9 Register Description

## Register Selection

Within this register the access to one of the RAM sections or to the Control register is selected. After one section is selected this section is valid as long as an other section is selected.

Table 6. Register Selection Address Map

| Register Section | Address |  |  |  |  |  |  |  |  | Data |  |  |  |  |  |  |  |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | HEX | A7 | A6 | A5 | A4 | A3 | A2 | A1 | A0 | HEX | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |  |
| NOP | 253 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | No operation |
| Data Frame 0 |  |  |  |  |  |  |  |  |  | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | Selection of RAM section for frame |
| Data Frame 1 |  |  |  |  |  |  |  |  |  | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |  |
| Data Frame 2 |  |  |  |  |  |  |  |  |  | 3 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |  |
| Data Frame 3 |  |  |  |  |  |  |  |  |  | 4 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |  |
| Data Frame 4 |  |  |  |  |  |  |  |  |  | 5 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |  |
| Data Frame 5 |  |  |  |  |  |  |  |  |  | 6 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |  |
| Control Register |  |  |  |  |  |  |  |  |  | 11 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | Selection of Control Register |

## Data Definition of the single frames

One frame consits of 2 blocks (à $8 \times 9$ LED-matrix) or 3 blocks (à $5 \times 6$ LED-matrix). This configuration is set in the AS1119 config register (see Table 20 on page 24).
In the internal DPRAM of the device 6 frames can be stored. For each frame the following parameters have to be stored.

- LED is ON or OFF.
- LED is steady ON or blinking.
- The intensity of every single LED can be set via a 8 bits PWM.

Note: After power-up the data in the DPRAM is undefined (either ' 0 ' or ' 1 ').

## 2 Blocks with 8x9 LED Matrix

The AS1119 can be configured to control two seperated blocks of LEDs matrixes. This must be set via the bit D0 in the AS1119 config register (see AS1119 Config Register (0x04) on page 24).

Figure 21. 8x9 LED Matrix with two blocks

Datasheet-Register Description

The adress structure (as shown in Table 7) within on frame is always the same independent which frame was selected via the register selection (see Table 6 on page 13).
Table 7. Dataframe Adress Structure for 2 Matrixes

|  | Adresses within frame (HEX code) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current Source |  | On I Off |  | Blink |  | Intensity |  |

In the intensity register (see Table 10) the brightness of every single LED can bes set via a 8bit PWM ( 255 steps).
Table 10. LEDs Intensity Register Format for 2 Matrixes Setup

Table 10. LEDs Intensity Register Format for 2 Matrixes Setup

3 Blocks with 5x6 LED Matrix
The AS1119 can be configured to control three seperated blocks of LEDs matrixes. This must be set via the bit D0 in the AS1119 config register (see AS1119 Config Register (0x04) on page 24).

Figure 22. 5x6 LED Matrix with 3 Matrixes

Table 11. Dataframe Adress Structure for 3 Matrixes

In Table 12 it's described which databit represents which LED in the matrix. Per default all databits are ' 0 ', meaning no LED is on. A '1' puts the LED on.

Note: LED A01 is the first LED of the Current Source 0 in the Matrix A. LED B01 is the first LED of the Current Source 6 in the Matrix B. and so on.

Table 12. LEDs ON/OFF Register Format for 3 Matrixes Setup

In the intensity register (see Table 14) the brightness of every single LED can be set via a 8bit PWM (255 steps).
Table 14. LEDs Intensity Register Format for 3 Matrixes Setup

Table 14. LEDs Intensity Register Format for 3 Matrixes Setup

## Control-Registers

The AS1119 devices contain 13 control-registers which are listed in Table 15. All registers are selected using a 8-bit address word, and communication is done via the serial interface. Select the Control Register via the Register Selection (see Table 6 on page 13).

Table 15. Control Register Address Map

| Register Name | HEX | Register Address |  |  |  |  |  |  |  | Register Data |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A7 | A6 | A5 | A4 | A3 | A2 | A1 | A0 | D7:D0 |
| Frame Address | 0x00 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | (see Table 16 on page 22) |
| Frame Play | 0x01 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | (see Table 17 on page 22) |
| Frame Time | 0x02 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | (see Table 18 on page 23) |
| Display Option | 0x03 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | (see Table 19 on page 23) |
| AS1119 Config | 0x04 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | (see Table 20 on page 24) |
| Current Source Matrix A | 0x05 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |  |
| Current Source Matrix B | 0x06 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | (see Table 21 on page 25) |
| Current Source Matrix C | 0x07 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |  |
| Chare Pump Config | 0x08 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | (see Table 22 on page 25) |

| Shutdown | 0x0A | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | (see Table 24 on page 26) |
| ${ }^{12} \mathrm{C}$ Interface Monitoring | 0x0B | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | (see Table 25 on page 26) |
| Open/Short Status | 0x0C | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | (see Table 26 on page 27) |
| AS1119 Status | 0x0D | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | (see Table 27 on page 27) |

## Frame Address Register (0x00)

In this register it must be set if a picture or a movie is to display on the LED matrix. Also the start address of the the movie or the picture which should be displayed must be set within this register. The default setting of this register is $0 \times 00$.

Table 16. Frame Address Register Format

| 0x00 Frame Address Register |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- | :--- | :---: | :---: |
| Bit | Bit Name | Default | Access |  |  |  | Bit Description |
| 7 | Play Movie | 0 | R/W | 0: no movie <br> 1: play movie |  |  |  |
| 6 | Display Picture | 0 | R/W | 0: no picture <br> 1: display picture |  |  |  |
| $5: 3$ | Start Address for movie |  | 000: Frame 0 <br> 001: Frame 1 <br> 010: Frame 2 <br> 011: Frame 3 <br> 100: Frame 4 <br> 101: Frame 5 |  |  |  |  |
| $2: 0$ | Address of Picture | 000 | R/W | 000: Frame 0 <br> 001: Frame 1 <br> 010: Frame 2 <br> 011: Frame 3 <br> 100: Frame 4 <br> 101: Frame 5 |  |  |  |

Note: If bit 6 and 7 are set to ' 1 ' the AS1119 will play the movie first and than the picture will be displayed.

## Frame Play Register (0x01)

Within this register two movie play obtions can be set. Per default this register is set to $0 \times 00$.

- The number of frames which are displayed in one movie.
- The number of loops to play in a movie.

Table 17. Frame Play Register Format

| $0 \times 01$ Frame Play Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7:6 | - | 00 | n/a |  |
| 5:3 | Number of loops played in one movie | $000$ | R/W | 000: no loop <br> 001: 1 loop <br> 010: 2 loops <br> 011: 3 loops <br> 100: 4 loops <br> 101: 5 loops <br> 110: 6 loops <br> 111: play endless |
| 2:0 | Number of frames to played in a movie | 000 | R/W | 000: 1 frame 001: 2 frames 010: 3 frames 011: 4 frames 100: 5 frames 101: 6 frames |

Note: To stopp a movie in play endless mode, bits D5:D3 have to be set to a value between 000 to 110 .

## Frame Time Register (0x02)

Every single frame in a movie is displayed for a certain time before the next frame is displayed. This time can be set within this register with 4 bits. The stated values in Table 18 are typical values. Per default this register is set to $0 \times 00$.

Table 18. Frame Time Register Format

| 0x02 Frame Time Register |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description | tion |
| 7:4 | - | 00 | n/a |  |  |
| 3:0 | Delay between frame change in a movie | 000 | R/W | 0000:play frame only one time <br> 0001: 32.5ms <br> 0010: 65ms <br> 0011: 97.5ms <br> 0100: 130ms <br> 0101: 162.5ms <br> 0110: 195ms <br> 0111: 227.5ms <br> 1000: 260ms <br> 1001: 292.5ms <br> 1010: 325ms <br> 1011:357.5ms <br> 1100: 390ms <br> 1101: 422.5ms <br> 1110: 455 ms <br> 1111: 487.5 ms |  |

## Display Option Register (0x03)

With the scan-limit it can be controlled how many digits are displayed in each matrix. When all 18 digits in the 2 matrix configuration are displayed, the display scan rate is 430 Hz (typ.). If the number of digits to display is reduced, the update frequency is increased. Per default this register is set to $0 \times 07$.

Table 19. Display Option Register Format

| 0x03 Display Option Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7 | - | 0 | n/a |  |
| 6 | intensity setting | 0 | R/W | 0: use intensity setting of frame 0 for all other frames <br> $1:$ set the intensity of each frame independently |
| 5 | start with blink | 0 | R/W | 0: start blinking with LED on <br> $1:$ start blinking with LED off |
| 4 | blink period | 0 | R/W | $0: 1.5 \mathrm{~s}$ <br> $1: 3 \mathrm{~s}$ |

Table 19. Display Option Register Format

| 0x03 Display Option Register |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |  |  |
| 3:0 | number of displayed current sources in one frame (scan-limit) | 0111 | R/W | 2 Matrix setting |  |  |
|  |  |  |  | Matrix A | Matrix B |  |
|  |  |  |  | 0000: CSO <br> 0001: CS0 to CS1 0010: CS0 to CS2 0011: CSO to CS3 0100: CS0 to CS4 0101: CS0 to CS5 0110: CS0 to CS6 0111: CS0 to CS7 1000: CS0 to CS8 | 0000: CS0 <br> 0001: CS0 to CS1 0010: CS0 to CS2 0011: CSO to CS3 0100: CS0 to CS4 0101: CS0 to CS5 0110: CS0 to CS6 0111: CS0 to CS7 1000: CS0 to CS8 |  |

## AS1119 Config Register (0x04)

In this register the configuration of the charge pumps is set to 2 or 3 blocks. The direction of the SYNC_IN/SYNC_OUT pin (input or output) is also set. Per default this register is set to $0 \times 00$.

Table 20. AS1119 Config Register Format

| 0x04 AS1119 Config Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| 7:3 | - | 00000 | n/a |  |
| 2:1 | Sync | 00 | R/W | 00: internal oscillator is system-clk. No synchronisation on pin B6. Tie pin to <br> high or low. <br> 01: internal oscillator is system-clk. System-clk is available on pin B6 for <br> synchronization. (output) <br> 10: internal oscillator is disabled. Pin B6 is used as clk input for system-clk. <br> 11: do not use |
| 0 | Matrix Configuration | 0 | R/W | $0: 3$ matrixes (à 5x6 LED-Matrix) <br> $1: 2$ matrixes (à 8x9 LED-Matrix) |

Current Source Block A, B, C Registers (0x05, 0x06, 0x07)
Within this registers the current for every single LED in one block can be set from 0 mA to 31 mA in 255 steps ( 8 bits). Per default this register is set to $0 \times 00$.

Table 21. Current Sourcer Register Format

| Current Source Registers |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |

| 7:0 | Analog Current Matrix A | 0000000 | R/W | 00000000: 0mA 11111111: 31mA |
| Address 0x06 |  |  |  |  |
| 7:0 | Analog Current Matrix B | 0000000 | R/W | 00000000: 0mA .......... <br> 11111111: 31mA |
| Address 0x07 |  |  |  | - |
| 7:0 | Analog Current Matrix C | 0000000 | R/W | 00000000: 0mA <br> 11111111: 31mA |

## Charge Pump Config Register (0x08)

In this register the characteristics of the Charge Pump can be set. By the use of the charge pump (bit 0 ) the supply voltage for the LEDs can be boosted to 1.5 - or 2-times of the device supply (VDD), if required. Additionally bit1 offers the option to check periodically if the LED supply can be reduced again during operation. This period is defined by bit 4:2
Alternatively, the LED supply can be (re)set to VDD by disabling the charge pump for a short time. In this case the period can be defined by user (application). Per default this register is set to $0 \times 1 \mathrm{E}$.

Table 22. AS1119 Config Register Format

| 0x08 Charge Pump Config Register |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- | :--- |
| Bit | Bit Name | Default | Access |  | Bit Description |
| $7: 5$ | - | 000 | $\mathrm{n} / \mathrm{a}$ |  |  |
| $4: 2$ | Timeframe for reduce <br> supply test | 111 | R/W | 000: 0.3 s <br> $001: 0.5 \mathrm{~s}$ <br> $010: 0.8 \mathrm{~s}$ <br> 011: 1.0 s <br> $100: 1.3 \mathrm{~s}$ <br> $101: 1.6 \mathrm{~s}$ <br> $110: 1.8 \mathrm{~s}$ <br> $111: 2.1 \mathrm{~s}$ |  |
| 1 | Reduce supply option | 1 | R/W | $0:$ reduce supply option off <br> $1:$ reduce supply option on |  |
| 0 | Charge Pump | 0 | R/W | 0: Charge Pump disable <br> $1:$ Charge Pump enable |  |

## Open/Short Test Register (0x09)

The AS1119 can detect open and shorted LEDs. To start this test the according bits have to be set. The result of the open/short test is written in the Open/Short staturs register (see Table 26). The default setting of this register is $0 \times 00$.

Table 23. Open/Short Test Register Format

| 0x09 Open/Short Test Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- |
| Bit | Bit Name | Default | Access | Bit Description |
| $7: 2$ | - | 000000 | n/a |  |
| 1 | Full Matrix | 0 | R/W | 0: all LED's are available in the matrixes <br> $1:$ not all LED's are available in the matrixes |
| 0 | Error detection | 0 | R/W | 0: start test <br> $1:$ no test |

The Open/Short test is only checking LEDs which are defined as ON in the Data Frame Registers Table 8 on page 14 or Table 12 on page 18. With the bit1 (Full Matrix) all LEDs of the matrixes will be defined as ON and will be tested intependently from the content of the Data Frame Register. The function of bit1 is only available during the open/short test and not during normal operation.

## Shutdown Register (0x0A)

The default setting of this register is $0 \times 00$. To get the AS1119 operational the bit DO has to be set to ' 1 '.
Table 24. Shutdown Register Format

| 0x0A Shutdown Register |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- | :---: |
| Bit | Bit Name | Default | Access |  |  |$\quad$ Bit Description |  |
| :--- |
| $7: 1$ |

## $I^{2} \mathrm{C}$ Interface Monitoring Register (0x0B)

This register is used to monitor the activity on the ${ }^{12} \mathrm{C}$ bus. If a deadlock situation occurs (e.g. the bus SDA pin is pulled to low and no communication is possible) the chip will reset the $I^{2} \mathrm{C}$ interface and the master is able to start the communication again.
The time window for the reset of the interface of the AS1119 can bes set via 7 bits from $256 \mu \mathrm{~s}$ to 33 ms . The default setting of this register is $0 x F F$.

Table 25. ${ }^{2}$ C Interface Monitoring Register Format

| Ox0B ${ }^{2} \mathrm{C}$ Interface Monitoring Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7:2 | Time out window | 1111111 | R/W | $\begin{aligned} & 0 \text { to } 127 \text { => } 1 \text { to } 128 \times 256 \mu \mathrm{~s} \\ & 0000000: 256 \mu \mathrm{~s} \\ & \ldots \ldots \ldots . . \\ & 1111111: 32.7 \mathrm{~ms} \end{aligned}$ |
| 0 | ${ }^{12} \mathrm{C}$ Monitor | 1 | R/W | 0 : $I^{2} \mathrm{C}$ monitoring off <br> 1: $I^{2} \mathrm{C}$ monitoring on |

## Open/Short Status Register (0x0C)

This is a read only register. Within this register the result of the open/short test can be read out. It's also stated if the test is completed or still running. The default setting of this register is $0 \times 00$.

Table 26. Open/Short Status Register Format

| Ox0C Open/Short Status Register |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :--- | :--- |
| Bit | Bit Name | Default | Access |  | Bit Description |
| 7 | - | 0 | n/a |  |  |
| 6 | status | 0 | R | 0: no test <br> 1: test ongoing |  |
| 5 | short test result <br> Matrix C | 0 | R | 0: no error detected <br> 1: short in Matrix C |  |
| 4 | short test result <br> Matrix B | 0 | $R$ | 0: no error detected <br> 1: short in Matrix B |  |
| 3 | short test result <br> Matrix A | 0 | $R$ | 0: no error detected <br> 1: short in Matrix A |  |
| 2 | open test result <br> Matrix C | 0 | $R$ | 0: no error detected <br> 1: open in Matrix C |  |
| 1 | open test result <br> Matrix B | 0 | R | 0: no error detected <br> 1: open in Matrix B |  |
| 0 | open test result <br> Matrix A | 0 | R | 0: no error detected <br> 1: open in Matrix A |  |

## AS1119 Status Register (0x0D)

This is a read only register. From this register the actual status of the AS1119 can be read out. The default setting of this register is $0 \times 00$. After an read command the bits $5: 4$ are set to ' 0 ' again automatically.

Table 27. AS1119 Status Register Register Format

| 0x0D AS1119 Status Register |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bit | Bit Name | Default | Access | Bit Description |
| 7 | - | 0 | n/a |  |
| 6 | Movie status |  |  | 0 : no movie is playing <br> 1: one movie is playing |
| 5:4 | Interrupt | $00$ | R | 00: no Interrupt triggered <br> 01: POR triggered an interrupt ${ }^{1}$ <br> 10: $I^{2} \mathrm{C}$ monitor triggered an interrupt <br> 11: both ( ${ }^{2} \mathrm{C}$ and POR) triggered an interrupt |
| 3:0 | actual displayed frame | 000 | R | 000: frame 0 001: frame 1 010: frame 2 011: frame 3 100: frame 4 101: frame 5 |

1. The power-on reset is part of the start sequence, hence after start-up this bit is also set.
