Specification Revision History

Doc. Version	Revision Description	Date
1.0	Initial version	
1.1	Change Power on reset content	06/30/2003
1.2	Cancel Code Option LVDD	05/27/2004

1   GENERAL DESCRIPTION

The EM78451 is an 8-bit microprocessor designed and developed with low-power and high speed CMOS technology. Its operation kernel is implemented with RISC-like architecture, and it is available in the mask ROM version. This device is also equipped with the Serial Peripheral Interface (SPI) function and an easy-implemented RS-232. The EM78451 is extremely suitable for wired communication. In fact, there are only fifty-eight (58) easy-to-learn instructions required plus the user's program can be emulated with the EMC In-Circuit Emulator (ICE).

2   FEATURES

- Operating voltage ranges between: 2.3V~5.5V.

- Operating temperature ranges between: 0°C~70°C.

- Operating frequency ranges between (based on 2 clocks):
  - 1Crystal mode: DC~20MHz at 5V, DC~8MHz at 3V, DC~4MHz at 2.3V.
  - RC mode: DC~4MHz at 5V, DC~4MHz at 3V, DC~4MHz at 2.3V.

- Low power consumption:
  - Less then 3 mA at 5V/4MHz
  - Typically 10 μA during sleep mode

- (SPI) Serial Peripheral Interface is also available.

- 4K × 13 bits on chip ROM (EM78451).

- 11 Special function registers.

- 140× 8 bits On- chip general-purpose registers.

- 5 Bi-directional I/O ports (35 I/O pins).

- 3 LED Direct sinking pins with internal serial resistors.

- Built-in RC oscillator with external serial resistor, ±10% variation.

- Built-in power-on reset.

- Five stacks designed for subroutine nesting.

- 8-bit Real time clock/counter (TCC) with overflow interrupt.

- Two to four machine -clocks for each instruction cycle.

- Power down mode.

- I/O ports have a Programmable wake-up function from sleep circuit.

- Programmable free running on-chip watchdog timer.

- 12 Wake-up pins.

(This specification is subject to change without further notice)

■ 2 Open-drain pins.

■ 2 R-option pins.

■ 32 Programmable pull-high input pins.

■ Package types:

● 40 pin DIP 600mil : EM78451AP.

● 44 pin QFP: EM78451AQ.

■ Four types of interrupts.

● External interrupt (/INT).

● SPI transmission completed interrupt.

● TCC overflow interrupt.

● Timer1 comparator match interrupt.

3 PIN ASSIGNMENT
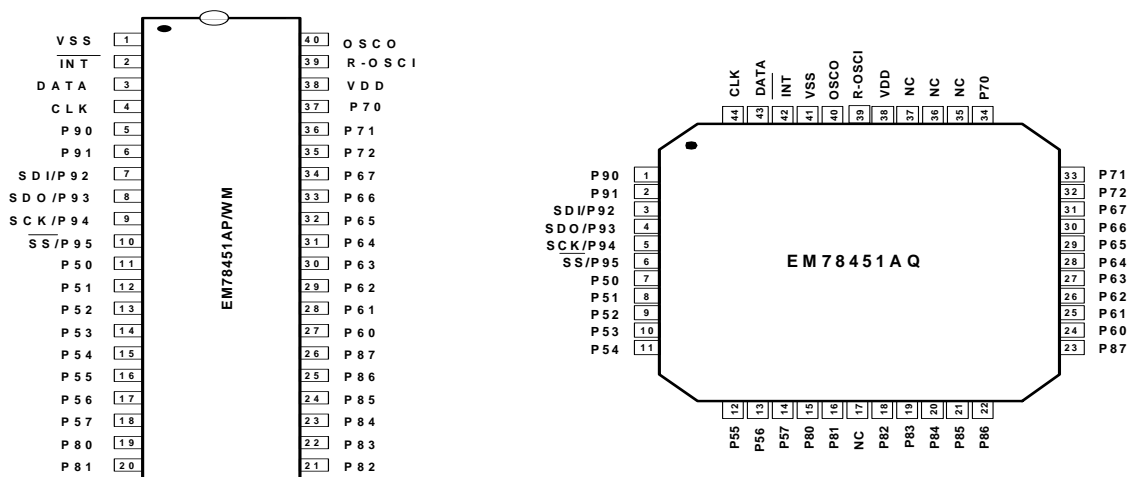

Fig. 1 Pin assignment

Table 1 Pin description

Symbol	Pin No.	Type	Function Description
R-OSCI	39	I	■ In XTAL mode: Crystal input; In internal C, external R mode: 56K ohm$\pm$5% pull high for 1.8432MHz.
OSCO	40	O	■ In XTAL mode: Crystal output; In RC mode: Instruction clock output.
P90~P95	5~10	I/O	■ General bi-directional I/O port. All of its pins can be pulled-high by software. ■ P90 and P91 are pin-change wake-up pins.
P80~P87	19~26	I/O	■ General bi-directional I/O port. All of its pins can be pulled-high by software. ■ P80 and P81 are also used as the R-option pins.
P70~P72	37~35	I/O	■ LED direct-driving pin with internal serial resistor is used as output and is software defined.
CLK	4	I/O	■ By connecting P74 and P76 together. ■ P74 can be pulled-high by software and it is also a pin-change wake-up pin. ■ P76 can be defined as an open-drain output.

Symbol	Pin No.	Type	Function Description
DATA	3	I/O	■ By connecting P75 and P77 together, P75 can be pulled-high by software and it is also a pin-change wake-up pin. ■ P77 can be defined as an open-drain output.
P60~P67	27~34	I/O	■ General bi-directional port. All of its pins can be pulled-high by software, and pin-change wake-up pins.
P50~P57	11~18	I/O	■ General bi-directional I/O port. All of its pins can be pulled-high * * by software.
VDD	38	-	■ Power supply pin.
VSS	1	-	■ Ground pin.
/INT	2	I	■ An interrupt schmitt-triggered pin. The function of interrupt triggers at the falling edge. Users can enable it by software. The internal pull-up resistor is around 50K ohm.
SDI	7	I/O	■ Serial data in for SPI
SDO	8	I/O	■ Serial data out for SPI.
SCK	9	I/O	■ Serial clock for SPI.
/SS	10	I/O	■ /Slave select for SPI.

4   FUNCTION DESCRIPTION
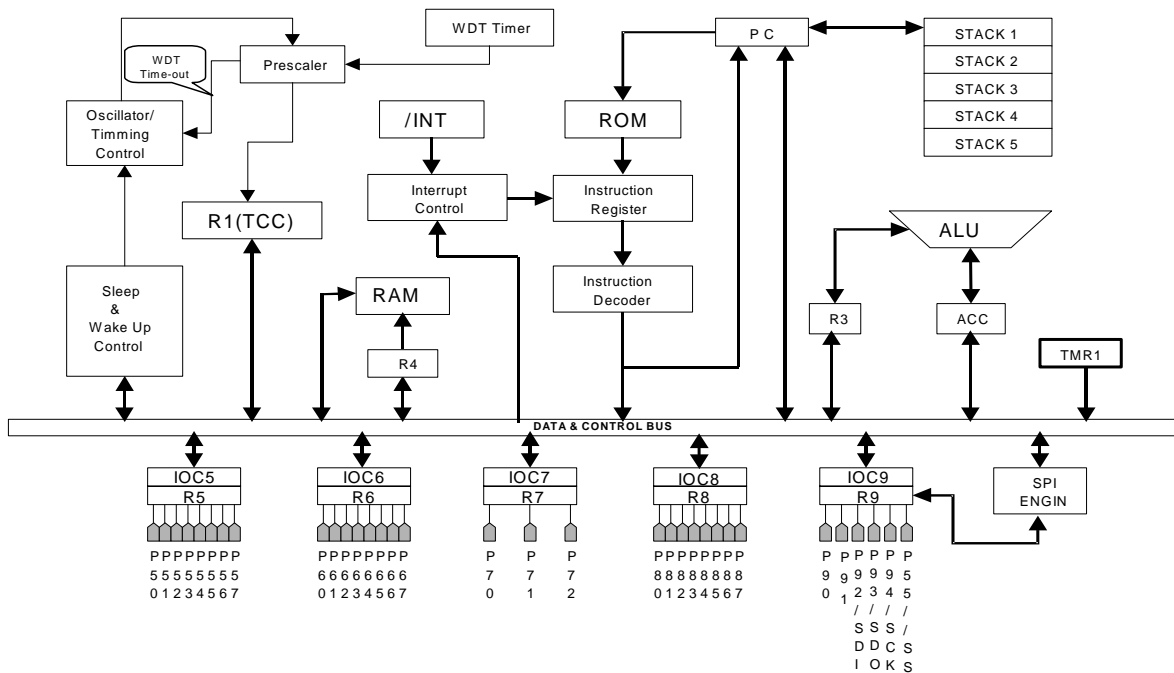

Fig. 2 Functional Block Diagram

4.1 Operational Registers

4.1.1 R0 (Indirect Address Register)

R0 is not a physically implemented register. It is used as an indirect addressing pointer. Any instruction using R0 as register actually accesses data pointed by the RAM Select Register (R4).

4.1.2 R1 (TCC)

■ It is increased by the instruction cycle clock.

■ Written and read by program as any other register.

4.1.3 R2 (Program Counter) & Stack

■ R2 and the hardware stacks are 12 bits wide.

■ The structure is depicted in Fig. 3.

■ Generates 4K × 13 on-chip ROM addresses to the relative programming instruction codes. One program page is 1024 words long.

■ All the R2 bits are set to "1"s as RESET condition occurs.

■ "JMP" instruction allows direct loading of the lower 10 program counter bits. Thus, "JMP" allows it to jump to any location on one page.

■ "CALL" instruction loads the lower 10 bits of the PC, and then PC+1 is pushed into the stack. Thus, the subroutine entry address can be located anywhere within a page.

■ "RET" ("RETL k", "RETI") instruction loads the program counter with the contents at the top of stack.

■ "MOV R2, A" allows the loading of an address from the "A" register to the lower 8 bits of PC, and the ninth and tenth bits (A8~A9) of PC are cleared.

■ "ADD R2, A" allows a relative address to be added to the current PC, and the ninth and tenth bits of PC are cleared.

■ Any instruction that is written to R2 (e.g. "ADD R2, A", "MOV R2, A", "BC R2,6",·····) (except "TBL") will cause the ninth and tenth bits (A8~A9) of PC to be cleared. Thus, the computed jump is limited to the first 256 locations of any program page.

■ "TBL" allows a relative address to be added to the current PC (R2+A→R2), and contents of the ninth and tenth bits (A8~A9) of PC are not changed. Thus, the computed jump can be on the second (or third, 4th) 256th locations on one program page.

■ In the case of EM78451, the most significant bit (A10,A11) will be loaded with the content of bit PS0 ~PS1 in the status register (R3) upon the execution of a "JMP", "CALL", or any other instructions which writes to R2.

■ All instructions are single instruction cycle (fclk/2 or fclk/4) except for the instruction that would change the contents of R2. Such instruction will need one more instruction cycle.
Fig. 3 Program counter organization

4.1.4 R3 (Status Register)

7	6	5	4	3	2	1	0
GP	PS1	PS0	T	P	Z	DC	C

Bit 0 (C) Carry flag

Bit 1 (DC) Auxiliary carry flag

Bit 2 (Z) Zero flag. Set to "1" if the result of an arithmetic or logic operation is zero.

Bit 3 (P) Power down bit. Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.

Bit 4 (T) Time-out bit. Set to 1 with the "SLEP" and the "WDTC" commands, or during power up and reset to 0 with WDT timeout.

Bits 5 (PS0) ~ 6 (PS1) Page select bits. PS0~PS1 are used to pre-select a program memory page. When executing a "JMP", "CALL", or other instructions which causes the program counter to be changed (e.g. MOV R2, A), PS0~PS1 are loaded into the 11th and 12th bits of the program counter where it selects one of the available program memory pages. Note that RET (RETL, RETI) instruction does not change the PS0~PS1 bits. That is, the return will always be the page from where the subroutine was called, regardless of the current settings of PS0~PS1 bits. PS1 bit is not used (read as "0") and cannot be modified in EM78451.

PS1	PS0	Program memory page [Address]
0	0	Page 0 [000-3FF]
0	1	Page 1 [400-7FF]
1	0	Page 2 [800-BFF]
1	1	Page 3 [C00-FFF]

Bit 7 (GP) General read/write bit.

4.1.5 R4 (RAM Select Register)

Bits 0~5 are used to select the registers (address: 00~3F) in the indirect addressing mode.

Bits 6~7 determines which bank is activated among the 4 banks.

If indirect addressing is not used, the RSR is used as an 8-bit general-purpose read/writer register.

See the configuration of the data memory in Fig. 4.

4.1.6 R5~R8 (Port 5 ~ Port8)

Four general 8 bits I/O registers

Both P74 and P76 read or write data from the DATA pin, while both P75 and P77 read or write data from the CLK pin.

4.1.7 R9 (Port9)

General 6-bit I/O registers.

The values of the two most significant bits are read as "0".

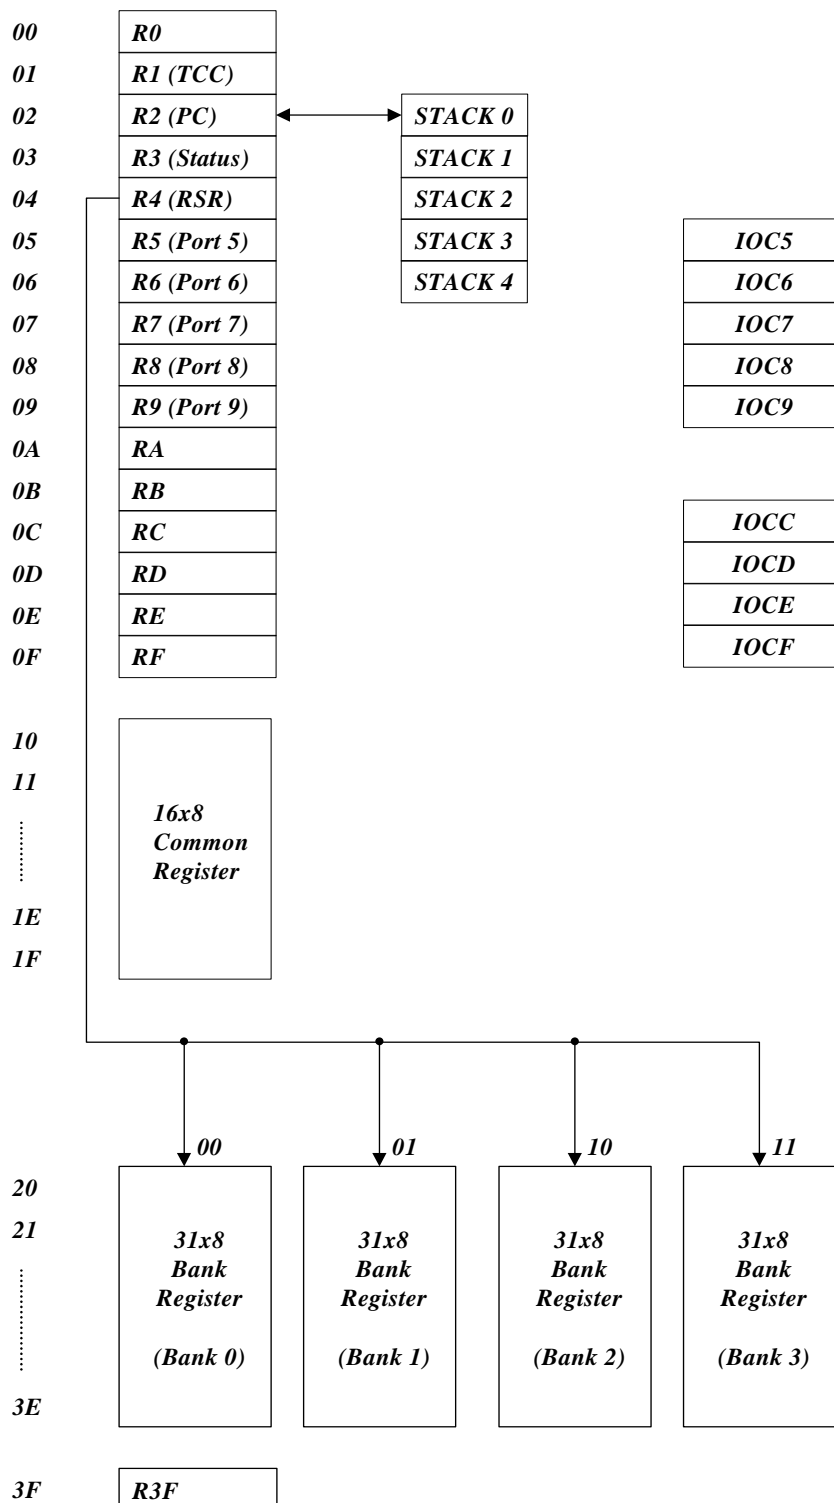

Fig. 4 Data Memory Configuration

4.1.8 RA (SPIRB: SPI Read Buffer)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0X0A	SPIRB/RA	SRB7	SRB6	SRB5	SRB4	SRB3	SRB2	SRB1	SRB0

SRB7~SRB0 are the 8-bit data when transmission is completed by SPI.

4.1.9 RB (SPIWB: SPI Write Buffer)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0B	SPIWB/RB	SWB7	SWB6	SWB5	SWB4	SWB3	SWB2	SWB1	SWB0

SWB7~SWB0 are the 8-bit data that is waiting for transmission by SPI.

4.1.10 RC (SPIS: SPI Status Register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0C	SPIS/RC	--	--	--	TM1IF	OD3	OD4	RBFIF	RBF

TM1IF (bit 4):

1 = In timer1 mode, receiving completed, and an interrupt occurs if enabled.

0 = In timer1 mode, receiving not completed, and an interrupt does not occur.

OD3 (bit 3):Open Drain Control bit

1 = Open-Drain enable for SDO,

0 = Open-Drain disable for SDO.

OD4 (bit 2):Open-Drain Control bit

1 = Open-Drain enable for SCK,

0 = Open-Drain disable for SCK.

RBFIF (bit 1): Read Buffer Full Interrupt flag

1 = Receiving completed, SPIRB is fully exchanged, and an interrupt occur if enable.

0 = Receiving not completed; SPIRB has not fully exchanged.

RBF (bit 0):Read Buffer Full flag

1 = Receiving completed; SPIRB is fully exchanged.

0 = Receiving not completed; and SPIRB has not fully exchanged.

4.1.11 RD (SPIC: SPI Control Register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0D	SPIC/RD	CES	SPIE	SRO	SSE	-	SBRS2	SBRS1	SBRS0

CES (bit 7): Clock Edge Select bit

1 = Data shifts out on falling edge, and shifts in on rising edge. Data is on hold during high level.

0 = Data shifts out on rising edge, and shifts in on falling edge. Data is on hold during low level.

SPIE (bit 6): SPI Enable bit

1= Enable SPI mode

0= Disable SPI mode

SRO (bit 5): SPI Read Overflow bit

1 = A new data is received while the previous data is still being held in the SPIB register. In this situation, the data in SPIS register will be destroyed. To avoid setting this bit, users are required to read the SPIRB registers although only the transmission has been implemented.

0 = No overflow.

> **NOTE**
> *This can only occur in slave mode.*

SSE (bit 4): SPI Shift Enable bit

1 = Start to shift, and keep on 1 while the current byte is still being transmitted.

0 = Reset as soon as the shifting is complete, and the next byte is ready to shift.

> **NOTE**
> *This bit will reset to 0 at every one-byte transmission by the hardware*

SBRS (bit 2~bit 0): SPI Baud Rate Select bits

SPI baud rate table is illustrated in the SPI section of this specification.

4.1.12 RE (TMR1: Timer1 register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0X0E	TMR1/RE	TMR17	TMR16	TMR15	TMR14	TMR13	TMR12	TMR11	TMR10

TMR17~TMR10 is bit sets of timer1 register and it increases until the value matches PWP and then it resets to 0.

4.1.13 RF (PWP: Pulse width preset register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0F	PWP/RF	PWP7	PWP6	PWP5	PWP4	PWP3	PWP2	PWP1	PWP0

PWP7~PWP0 are the bit sets of pulse width preset in advance for the desired baud clock width.

4.1.14 R20~R3E (General Purpose Register)

RA~R1F, and R20~R3E (including Banks 0~3) are general-purpose registers.

4.1.15 R3F (Interrupt Status Register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x3F	ISR/R3F	-	-	-	-	TM1IF	SPIIF	EXIF	TCIF

Bit 0 (TCIF) TCC timer overflow interrupt flag. Set as TCC overflow; flag cleared by software.

Bit 1 (EXIF) External interrupt flag. Set by falling edge on /INT pin, flag cleared by software

Bit 2 (SPIIF) SPI interrupt flag. Set by completion of data transmission, flag cleared by software.

Bit 3 (TM1IF) Timer1 interrupt flag. Set by the comparator at Timer1 application, flag cleared by software.

Bits 2~7 are not used and read as "0".

"1" means interrupt request, "0" means non-interrupt.

R3F can be cleared by instruction, but cannot be set by instruction.

IOCF is the interrupt mask register.

Note that to read R3F will result of "logic AND" of R3F and IOCF.

4.2 Special Purpose Registers

4.2.1 A (Accumulator)

■ Internal data transfer, or instruction operand holding.

■ A non-addressable register.

4.2.2 CONT (Control Register)

7	6	5	4	3	2	1	0
/PHEN	/INT	-	-	PAB	PSR2	PSR1	PSR0

Bit 7 (/PHEN) I/O pin pull-high enable flag.

   0: For P60~P67, P74~P75 and P90~P95, the pull-high function is enabled.

   1: The pull-high function is disabled.

Bit 6 (INT) An interrupt enable flag cannot be written by the CONTW instruction.

   0: interrupt masked by the DISI instruction.

   1: interrupt enabled by the ENI or RETI instruction.

Bit4, 5 Not used, and to be read as "0".

Bit 3 (PAB) Prescaler assignment bit.

   0: TCC

   1: WDT

Bit 0 (PSR0) ~ Bit 2 (PSR2) TCC/WDT prescaler bits.

PSR2	PSR1	PSR0	TCC Rate	WDT Rate
0	0	0	1:2	1:1
0	0	1	1:4	1:2
0	1	0	1:8	1:4
0	1	1	1:16	1:8
1	0	0	1:32	1:16
1	0	1	1:64	1:32
1	1	0	1:128	1:64
1	1	1	1:256	1:128

Bits 0~3, and 7 of the CONT register are readable and writable.

4.2.3   IOC5 ~ IOC9 (I/O Port Control Register)

"1" put the relative I/O pin into high impedance, while "0" put the relative I/O pin as output.

Both P74 and P76 should not be defined as output pins at the same time; this also applies to both P75 and P77.

Only the lower 6 bits of the IOC9 register are used.

4.2.4   IOCC (T1CON: Timer1 control register)

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0C	T1CON/IOCC	0	0	0	0	0	TM1E	TM1P1	TM1P0

TM1E (bit2): Timer1 Function Enable bit

   1 = Enable timer1 function.

   0 = Disable timer1 function as default.

TM1P (bit1~bit0): Timer1 Prescaler bit

Refer to the Timer1 prescaler table for FOSC illustration under the section "Timer1" on the subsequent pages.

4.2.5   IOCD (Pull-high Control Register)

7	6	5	4	3	2	1	0
S7	-	-	-	/PU9	/PU8	/PU6	/PU5

The default values of /PU5, /PU6, /PU8, and /PU9 are "1" which means the pull-high function is disabled.

/PU6 and /PU9 are "AND" gating with /PHEN, that is, when each one is written as"0," pull high is enabled.

S7 defines the driving ability of the P70-P72.

0: Normal output.

1: Enhance the driving ability of LED.

4.2.6   IOCE (WDT Control Register)

7	6	5	4	3	2	1	0
-	ODE	WDTE	SLPC	ROC	-	-	/WUE

Bit 0 (/WUE) This control bit is used to enable the wake-up function of P60~P67, P74~P75, and P90~P91.

0: Enable the wake-up function.

1: Disable the wake-up function.

The /WUE bit can be read and written.

Bit 3 (ROC) ROC is used for the R-option. Setting ROC to "1" will enable the status of R-option pins (P80, P81) to be read by the controller. Clearing ROC will disable the R-option function. Otherwise, the R-option function is introduced. Users must connect the P81 pin or/and P80 pin to VSS by a 560KΩ external resistor (Rex). If Rex is connected/disconnected with VDD, the status of P80 (P81) will be read as "0"/"1" (refer to Fig. 7(b)). The ROC bit can be read and written.

Bit 4 (SLPC) This bit is set by hardware at the falling edge of wake-up signal and is cleared in software. SLPC is used to control the oscillator operation. The oscillator is disabled (oscillator stops, and the controller enters the LEEP2 mode) on the high-to-low transition and is enabled (the controller is awakened from SLEEP2 mode) on low-to-high transition. In order to ensure the stable output of the oscillator, once the oscillator is enabled again, there is a delay of approximately 18 ms (oscillator start-up timer (OST)) before the next program instruction is executed. The OST is

always activated by wake-up from sleep mode whether the Code Option bit ENWDT is "0" or not. After waking up, the WDT is enabled if Code Option ENWDT is "1". The block diagram of SLEEP2 mode and wake-up caused by input triggered is depicted in Fig. 5. The SLPC bit can be read and written.

Bit 5 (WDTE) Control bit used to enable Watchdog timer.

The WDTE bit can be used only if ENWDT, the CODE Option bit, is "1". If the ENWDT bit is "1", then WDT can be disabled/enabled by the WDTE bit.

0: Disable WDT.

1: Enable WDT.

The WDTE bit is not used if ENWDT, the CODE Option bit ENWDT, is "0". That is, if the ENWDT bit is "0", WDT is always disabled regardless of what the WDTE bit is.

The WDTE bit can be read and written.

Bit 6 (ODE) Open-drain control bit.

0: Both P76 and P77 are normally I/O pins.

1: Both P76 and P77 pins have the open-drain function inside.

The ODE bit can be read and written.

Bits 1~2, and 7 Not used.

4.2.7 IOCF (Interrupt Mask Register)

7	6	5	4	3	2	1	0
-	-	-	-	TM1IE	SPIIE	EXIE	TCIE

Bit 0 (TCIE) TCIF interrupt enable bit.

0: disable TCIF interrupt

1: enable TCIF interrupt

Bit 1 (EXIE) EXIF interrupt enable bit.

0: disable EXIF interrupt

1: enable EXIF interrupt

Bit 2 (SPIIE) SPI interrupt enable bit.

0: disable SPI interrupt

1: enable SPI interrupt

Bit 3 (TM1IE) TM1IE interrupt enable bit.

        0: disable TM1IE interrupt

        1: enable TM1IE interrupt

Bits 4~7 Not used.

Individual interrupt is enabled by setting its associated control bit in IOCF to "1".

The IOCF Register could be read and written.
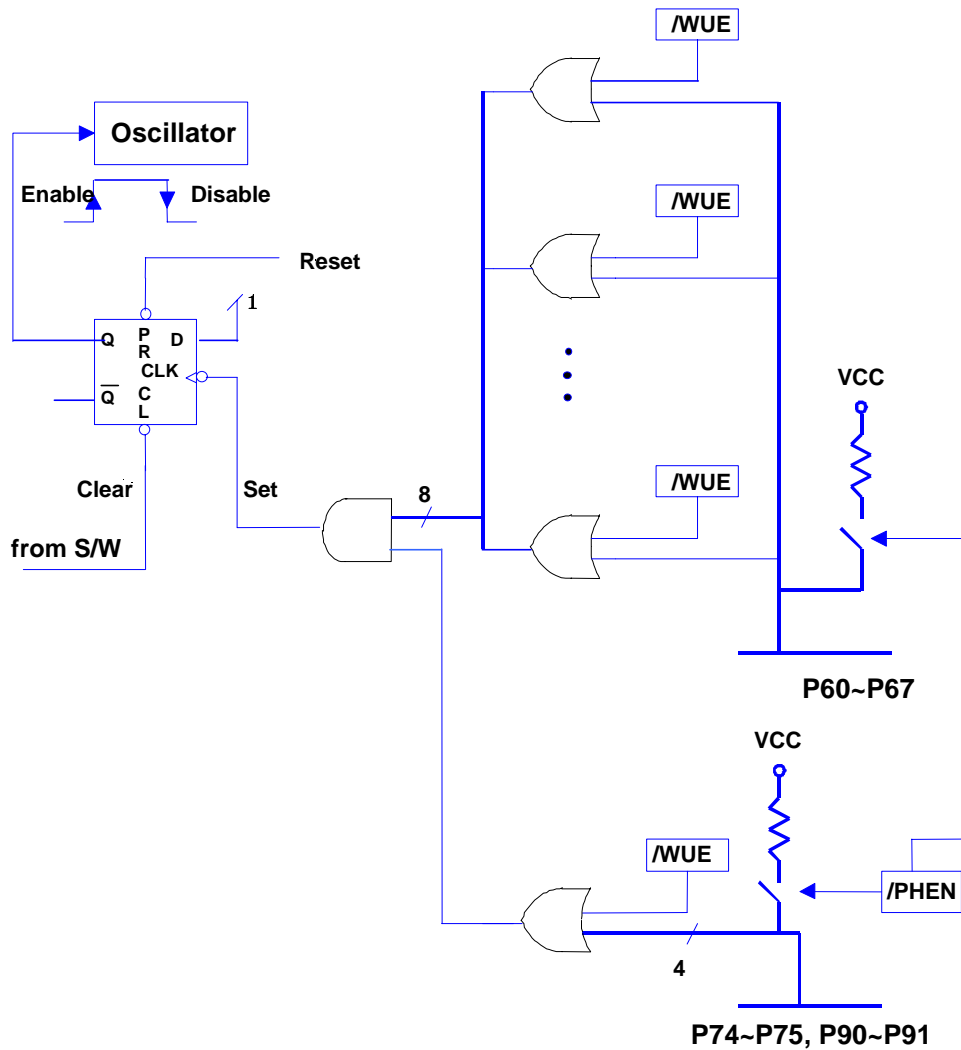

Fig. 5 Block Diagram of Sleep Mode and Wake-up Circuits on I/O Ports

4.3 TCC/WDT Presacler

An 8-bit counter is available as prescaler for the TCC or WDT. The prescaler is available for either the TCC or WDT at any given time, and the PAB bit of CONT register is used to determine the prescaler assignment. The PSR0~PSR2 bits determine the prescale ratio. The prescaler is cleared each time the instruction is written to TCC under TCC mode. The WDT and prescaler, when assigned to WDT mode, are cleared by the WDTC or SLEP instructions. Fig. 6 depicts the circuit diagram of TCC/WDT.

■ R1(TCC) is an 8-bit timer/counter. TCC will increase by one at every instruction cycle (without the prescaler).

■ The watchdog timer is a free running on-chip RC oscillator. The WDT will keep running even when the oscillator driver has been turned off (i.e. in sleep mode). During normal operation or sleep mode, a WDT time-out (if enabled) will cause the device to reset. The WDT can be enabled or disabled any time during the normal mode by software programming (if Code Option bit ENWDT is "1"). Refer to WDTE bit of IOCE register. Without presacler, the WDT time-out period is approximately 18 ms[1].

4.4 I/O Ports

The I/O registers, from Port 5 to Port 9, are bi-directional tri-state I/O ports. P60~P67, P74~P75, and P90~P91 provide the internal pull-high. P60~P67, P74~P75, and P90~P95 provide programmable wake-up function through software. P76~P77 can have an open-drain output by software control. P80~P81 are the R-option pins which are enabled by software. When the R-option function is used, it is recommended that P80 and P81 should be used as output pins. During the R-option enabled state, P80 and P81 must be programmed as input pins. If an external resistor is connected to P80 (P81) for the R-option function, the current consumption, if necessary, should be taken as an important factor in the applications for low power consideration.

The I/O ports can be defined as "input" or "output" pins by the I/O control registers (IOC5~IOC9) under program control. The I/O registers and I/O control registers are both readable and writable. The I/O interface circuit is shown in Fig. 7. Note that the reading path source of input and output pins is different when reading the I/O port.

---

[1] NOTE: Vdd = 5V, set up time period = 16.2ms ± 5%
Vdd = 3V, set up time period = 18.0ms ± 5%

4.5 SERIAL PERIPHERAL INTERFACE MODE

4.5.1 Overview & Features

Overview:

Figure 8, 9, and 10 shows how the EM78451 communicates with other devices through the SPI module. If EM78451 is a master controller, it sends clock through the SCK pin. A couple of 8-bit data are transmitted and received at the same time. However, if EM78451 is defined as a slave, its SCK pin could be programmed as an input pin. Data will continue to be shifted based on both the clock rate and the selected edge.

Features:

■ Operation in either Master mode or Slave mode,

■ Three-wire or four-wire synchronous communication; that is, full duplex

■ Programmable baud rates of communication,

■ Programming clock polarity, (RD bit7)

■ Interrupt flag available for the read buffer full,

■ Up to 8 MHz (maximum) bit frequency,
Fig. 8 SPI Master/Slave Communication
Fig. 9 The SPI Configuration of Single-Master and Multi-Slave
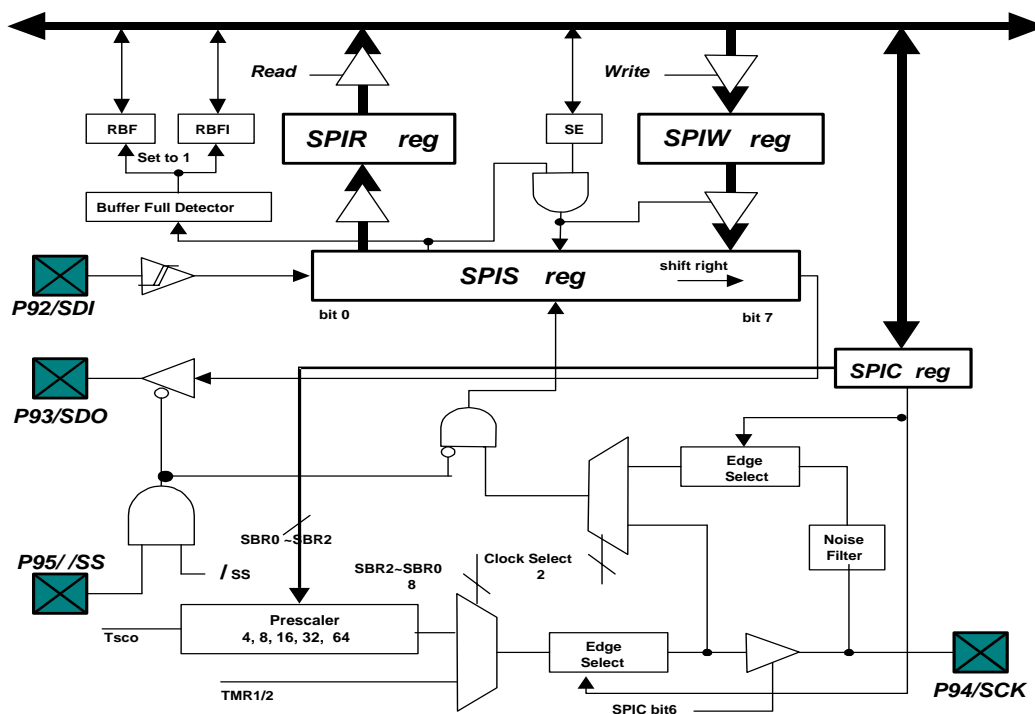

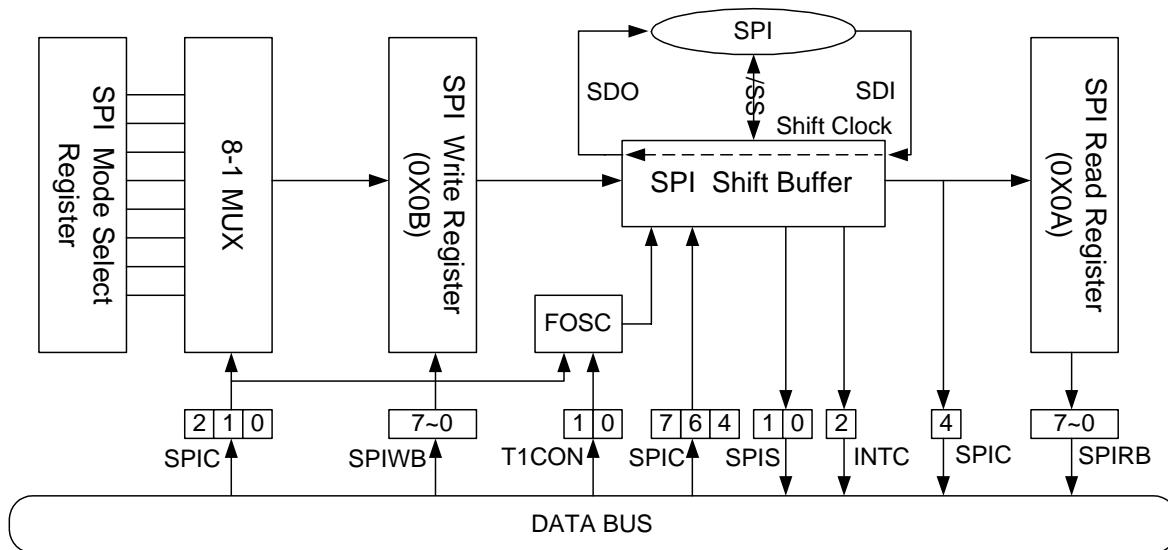

Fig. 12 The Function Block Diagram of SPI Transmission

The following describes the function of each block and explains how to carry out the SPI communication with the signals depicted in Fig.11 and Fig.12:

■ P92/SDI:Serial Data In.

■ P93/SDO:Serial Data Out.

■ P94/SCK:Serial Clock.

■ P95//SS:/Slave Select (Option). This pin (/SS) may be required during a slave mode.

■ RBF: Set by Buffer Full Detector, and reset in software.

■ RBIF:Set by Buffer Full Detector, and reset in software.

■ Buffer Full Detector: Sets to 1, when an 8-bit shifting is completed.

■ SSE:Loads the data in SPIS register, and begin to shift

■ SPIS reg.:Shifting byte in and out. The MSB is shifted first. Both the SPIS and SPIW registers are loaded at the same time. Once the data are written, SPIS starts with the transmission / reception. The data received will be moved to the SPIR register, as the shifting of the 8-bit data is completed. The RBF (Read Buffer Full) flag and the RBFI (Read Buffer Full Interrupt) flag are then set.

■ SPIR reg.:Read buffer. The buffer will be updated as the 8-bit shifting is completed. The data must be read before the next reception is finished. The RBF flag is cleared as the SPIR register reads.

■ SPIW reg.:Write buffer. The buffer will deny any attempt to write until the 8-bit shifting is completed.

The SSE bit will be kept in 1 if the communication is still undergoing. This flag must be cleared as the shifting is completed. Users can determine if the next write attempt is available.

■ SBRS2~SBRS0: Programming the clock frequency/rates and sources.

■ Clock Select:Selecting either the internal or the external clock as the shifting clock.

■ Edge Select:Selecting the appropriate clock edges by programming the CES bit

4.5.3   SPI Signal & Pin Description

The detailed functions of the four pins, SDI, SDO, SCK, and /SS, which are shown in Fig. 9, are as follows:

SDI/P92 (Pin 7):

■ Serial Data In,

■ Receive sequentially, the Most Significant Bit (MSB) first, the Least Significant Bit (LSB) last,

■ Defined as high-impedance, if not selected,

■ Program the same clock rate and clock edge to latch on both the master and slave devices,

■ The byte received will update the transmitted byte,

■ Both the RBF and the RBFIF bits (located in Register 0x0C) will be set as the SPI operation is completed.

■ Timing is shown in Fig.13 and Fig. 14.

SDO/P93 (Pin 8):

■ Serial Data Out,

■ Transmit sequentially; the Most Significant Bit (MSB) first, the Least Significant Bit (LSB) last,

■ Program the same clock rate and clock edge to latch on both the master and slave devices,

■ The byte received will update the transmitted byte,

■ The CES (located in Register 0x0D) bit will be reset, as the SPI operation is completed.

■ Timing is shown in Fig.13 and 14.

SCK/P94 (Pin 9):

■ Serial Clock

■ Generated by a master device

■ Synchronize the data communication on both the SDI and SDO pins

■ The CES (located in Register 0x0D) is used to select the edge to communicate

■ The SBR0~SBR2 (located in Register 0x0D) is used to determine the baud rate of communication

■ The CES, SBR0, SBR1, and SBR2 bit have no effect in the slave mode

■ Timing is show in Fig.13 and 14

/SS/P95 (Pin 10):

■ Slave Select; negative logic,

■ Generated by a master device to signify the slave(s) to receive data,

■ Goes low before the first cycle of SCK appears and remains low until the last (eighth) cycle is completed,

■ Ignores the data on the SDI and SDO pins when /SS is high, because the SDO is no longer driven.

■ Timing is shown in Fig.13 and Fig. 14.

4.5.4 *Programming the related registers*

The related registers for defining SPI mode are shown in Table 2 and 3.

Table 2 Related Control Registers of the SPI Mode

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0D	*SPIC/RD	CES	SPIE	SRO	SSE	--	SBR2	SBR1	SBR0
0x0F	INTC/IOCF	--	--	--	--	TM1IE	SPIIE	EXIE	TCIE

SPIC: SPI Control Register.

CES (bit 7): Clock Edge Select bit

   1 = Data shifts out on falling edge, and shifts in on rising edge. Data is on hold during the high level.

   0 = Data shifts out on rising edge, and shifts in on falling edge. Data is on hold during the low level.

SPIE (bit 6): SPI Enable bit

   1 = Enable SPI mode

   0 = Disable SPI mode

SRO (bit 5): SPI Read Overflow bit

> 1 = A new data is received while the previous data is still being on hold in the SPIB register. Under this condition, the data in SPIS register will be destroyed. To avoid setting this bit, users should read the SPIRB register even if the transmission is implemented only.

> 0 = No overflow.

NOTE
This can only occur under slave mode.

SSE (bit 4): SPI Shift Enable bit

> 1 = Start to shift, and stays on 1 while the current byte continues to transmit.

> 0 = Reset as soon as the shifting is completed, and the next byte is ready to shift.

NOTE
This bit can be reset by hardware only.

SBRS (bit 2~0): SPI Baud Rate Select Bits

SBRS2 (Bit 2)	SBRS1 (Bit 1)	SBRS0 (Bit 0)	Mode	Baud Rate
0	0	0	Master	Fsco/2
0	0	1	Master	Fsco/4
0	1	0	Master	Fsco/8
0	1	1	Master	Fsco/16
1	0	0	Master	Fsco/32
1	0	1	Slave	/SS enable
1	1	0	Slave	/SS disable
1	1	1	Master	TMR1/2

NOTE
In master mode, /SS is disable.

INTC: Interrupt control register

Bit 3 (TM1IE) TM1IE interrupt enable bit.

> 0: disable TM1IE interrupt

> 1: enable TM1IE interrupt

Bit 2 (SPIIE) SPI interrupt enable bit.

> 0: disable SPI interrupt

> 1: enable SPI interrupt

Bit 1 (EXIE) EXIF interrupt enable bit.

> 0: disable EXIF interrupt

> 1: enable EXIF interrupt

Bit 0 (TCIE) TCIF interrupt enable bit.

> 0: disable TCIF interrupt

> 1: enable TCIF interrupt

Table 3 Related Status/data Registers of the SPI Mode

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0X0A	SPIRB/RA	SRB7	SRB6	SRB5	SRB4	SRB3	SRB2	SRB1	SRB0
0x0B	SPIWB/RB	SWB7	SWB6	SWB5	SWB4	SWB3	SWB2	SWB1	SWB0
0x0C	SPIS/RC	0	0	0	TM1IF	OD3	OD4	RBFIF	RBF

SPIRB: SPI Read Buffer. Once the serial data is received completely, it will load to SPIRB from SPISR. The RBF bit and the RBFIF bit in the SPIS register will also be set.

SPIWB: SPI Write Buffer. As transmitted data is loaded, the SPIS register stands by and starts to shift the data when sensing SCK edge with SSE set to "1".

SPIS: SPI Status register

TM1IF (bit4): Timer1 interrupt flag.

OD3 (bit 3): Open-Drain Control bit (P93)

> 1 = Open-drain enable for SDO,

> 0 = Open-drain disable for SDO.

OD4 (bit 2): Open-drain Control bit (P94)

> 1 = Open-drain enable for SCK,

> 0 = Open-drain disable for SCK.

RBFIF (bit 1): Read Buffer Full Interrupt flag

> 1 = Receive is completed, SPIB is full, and an interrupt occurs if enabled.

> 0 = Receive is ongoing, SPIB is empty.

RBF (bit 0): Read Buffer Full flag

　　　1 = Receive is completed, SPIB is full.

　　　0 = Receive is ongoing, SPIB is empty.

4.5.5　SPI Mode Timing

The edge of SCK is selected by programming bit CES. The waveform shown in Fig.13 is applicable regardless of whether the EM78451 is under master or slave mode with /SS disabled. However, The waveform in Fig. 14 can only be implemented in slave mode with /SS enabled.
Fig. 13 SPI Mode with /SS Disable

4.6 Timer 1

4.6.1   Overview

Timer1(TMR1) is an eight-bit clock counter with a programmable prescaler. It is designed for the SPI module as a baud rate clock generator. TMR1 can be read, written, and cleared on any reset conditions. If employed, it can be turned down for power saving by setting TMR1EN bit [T1CON<2>] to 0.

4.6.2   Function description

Fig. 15 shows TIMER1 block diagram. Each signal and block is described as follows:
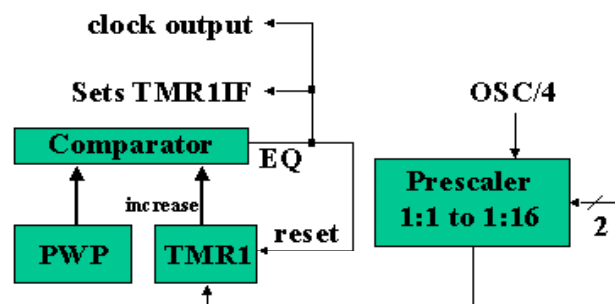

Fig. 15 TIMER1 Block Diagram

■ OSC/4:Input clock.

■ Prescaler: Option of 1:1, 1:4, 1:8, and 1:16 defined by T1P1 and T1P02(T1CON<1, 0>). It is cleared when a value is written to TMR1 or T1CON, and during any kind of reset as well.

■ PWP: Pulse width preset register; the desired width of baud clock is written in advance.

■ TMR1: Timer 1 register; TMR1 increases until it matches with PWP, and then resets to 0. If it is chosen optionally in the SPI mode, its output is fed as a shifting clock.

■ Comparator: To change the output status while a match occurs. The TMR1IF flag will be set at the same time.

4.6.3   Programmed the related registers

The related registers for defining TMR1 are shown in Table 4 and Table 5

Table 4 Related Control Registers of the TMR1

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x0C	SPIS/RC	0	0	0	TM1IF	OD3	OD4	RBFIF	RBF
0x0F	INTC/IOCF	0	0	0	0	TM1IE	SPIIE	EXIE	TCIE

Table 5 Related Status/Data Registers of TMR1

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0X0E	TMR1/RE	TMR17	TMR16	TMR15	TMR14	TMR13	TMR12	TMR11	TMR10
0x0F	PWP/RF	PWP7	PWP6	PWP5	PWP4	PWP3	PWP2	PWP1	PWP0
0x0C	T1CON/IOCC	0	0	0	0	0	TM1E	TM1P1	TM1P0

TMR1: Timer1 Register

TMR17~TMR10 is bit set of Timer1 register and it increases until the value matches the PWP and then it resets to 0.

PWP: Pulse Width Preset Register

PWP7~PWP0 is bit set of pulse width preset for the desire width of baud clock in advance.

T1CON: Timer1 Control Register

TM1E (bit2): Timer1 enable bit

TM1P1 and TM1P0 (bit1~0): Timer1 prescaler for FSCO

TM1P1	TM1P0	Prescaler Rate
0	0	1:1
0	1	1:4
1	0	1:8
1	1	1:16

4.7 RESET and Wake-up

A RESET is initiated by:

(1) Power on reset, or

(2) WDT timeout. (if enabled)
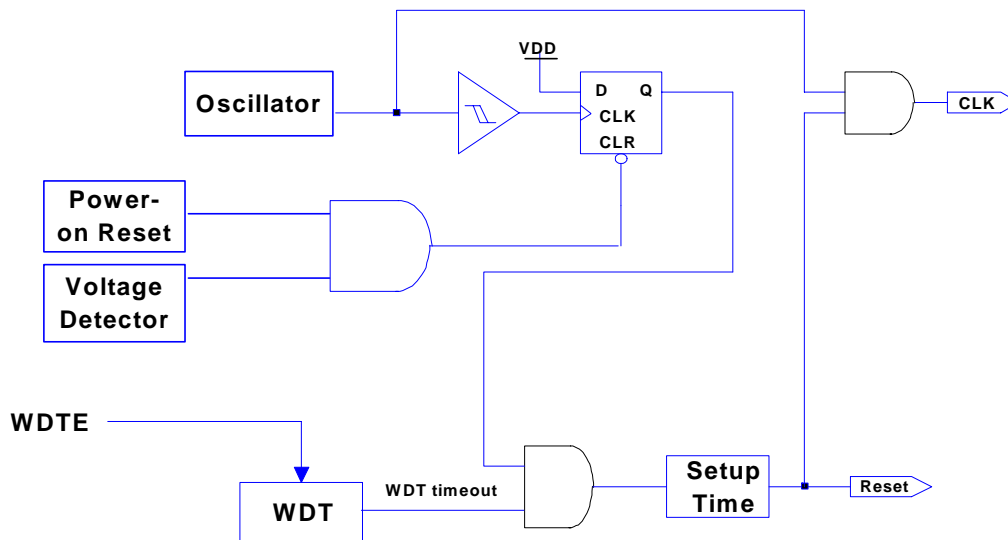

Fig. 16 Block Diagram of Reset

The POR voltage of EM78451 ranges between 1.2V~1.8V. Under customer application, when power is OFF, Vdd must drop below 1.2V and remains OFF for 10us before power can be switched ON again. This way, the EM78451 will reset and work normally. The extra external reset circuit will work well if Vdd can rise at a very fast speed (50 ms or less). However, under most cases where critical applications are involved, extra devices are required to assist in solving the power-up problems.

The device is kept in a RESET condition for a period of approximately 18ms**2** (one oscillator start-up timer period) after the reset is detected. Fig.16 shows the block diagram of reset. Once the RESET occurs, the following functions are performed:

■ The oscillator is running or it will be started.

■ The Program Counter (R2) is set to all "1".

■ When power is switched on, bits 5~6 of R3 and the upper 2 bits of R4 are cleared.

■ All I/O port pins are configured as input mode (high-impedance state).

■ The Watchdog timer and prescaler are cleared.

■ The Watchdog timer is enabled if Code Option bit ENWDT is "1".

■ The CONT register is set to all "1" except bit 6 (INT flag).

---

2 NOTE: Vdd = 5V, set up time period = 16.2ms ± 5%
          Vdd = 3V, set up time period = 18.0ms ± 5%

■ Bits 3,6 of IOCE register are cleared, bits 0,4~5 of IOCE register are set to "1".

■ Bits 0 of R3F and bits 0 of IOCF registers are cleared.

The sleep mode (power down) is achieved by executing the SLEP instruction (named as SLEEP1 MODE). While entering sleep mode, the WDT (if enabled) is cleared but keeps on running. The controller is awakened by WDT timeout (if enabled), and it will cause the controller to reset. The T and P flags of R3 are used to determine the source of the reset (wake-up).

In addition to the basic SLEEP1 MODE, EM78451 has another sleep mode (caused by clearing "SLPC" bit of IOCE register, designated as SLEEP2 MODE). In the SLEEP2 MODE, the controller can be awakened by:

(a) Any one of the wake-up pins is set to "0" (refer to Fig.17). Upon waking, the controller will continue to execute the program in-line. In this case, before entering SLEEP2 MODE, the wake-up function of the trigger sources (P60~P67, P74~P75, and P90~P91) should be selected (e.g. input pin) and enabled (e.g. pull-high, wake-up control). One caution should be noted is that after waking up, the WDT is enabled if Code Option bit ENWDT is "1". The WDT operation (to be enabled or disabled) should be appropriately controlled by software after waking up.

(b) WDT time-out (if enabled). During wake-up, it will cause the controller to reset.

Table 6 The Summary of the Initialized Values for Registers

Address	Name	Reset Type	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

** To execute the next instruction after the "SLPC" bit status of IOCE register being on high-to-low transition.

X: Not used.   U: Unknown or don't care.P: Previous value before reset.   t: Check Table 7

The Status of RST, T, and P of STATUS Register

A RESET condition is initiated by the following events:

1. A power-on condition.

2. Watchdog timer time-out.

The values of T and P, listed in Table 7 are used to check how the processor wakes up.

Table 8 shows the events that may affect the status of T and P.

Table 7 The Values of RST, T and P After RESET

Reset Type	T	P
Power on	1	1
WDT during Operating mode	0	P
WDT wake-up during SLEEP1 mode	0	0
WDT wake-up during SLEEP2 mode	0	P
Wake-Up on pin change during SLEEP2 mode	P	P

*P: Previous status before reset

Table 8 The Status of RST, T and P Being Affected by Events

Event	T	P
Power on	1	1
WDTC instruction	1	1
WDT time-out	0	*P
SLEP instruction	1	0
Wake-Up on pin change during SLEEP2 mode	P	P

*P: Previous value before reset

4.8 Interrupt

The EM78451 has the following interrupts.

1. TCC overflow interrupt

2. External interrupt (/INT)

3. (SPI) Serial Peripheral Interface. Transmission completed interrupt.

4. Timer1 comparator completed interrupt.

R3F is the interrupt status register, which records the interrupt request in flag bit. IOCF is the interrupt mask register. Global interrupt is enabled by ENI instruction and is disabled by DISI instruction. When one of the interrupts (if enabled) is generated, it will cause the next instruction to be fetched from address 001H. Once in the interrupt service routine the source of the interrupt can be determined by polling the flag bits in the R3F register. The interrupt flag bit must be cleared by software before leaving the interrupt service routine and enabling interrupts to avoid recursive interrupts.

The flag in the Interrupt Status Register (R3F) is set regardless of the status of its mask bit or the execution of ENI instruction. Note that reading R3F will obtain the output of logic AND of R3F and IOCF (refer to Fig. 17). The RETI instruction will exit interrupt routine and enables the global interrupt (execution of ENI instruction).

When an interrupt is generated by INT instruction (if enabled), it causes the next instruction to be fetched from address 002H.

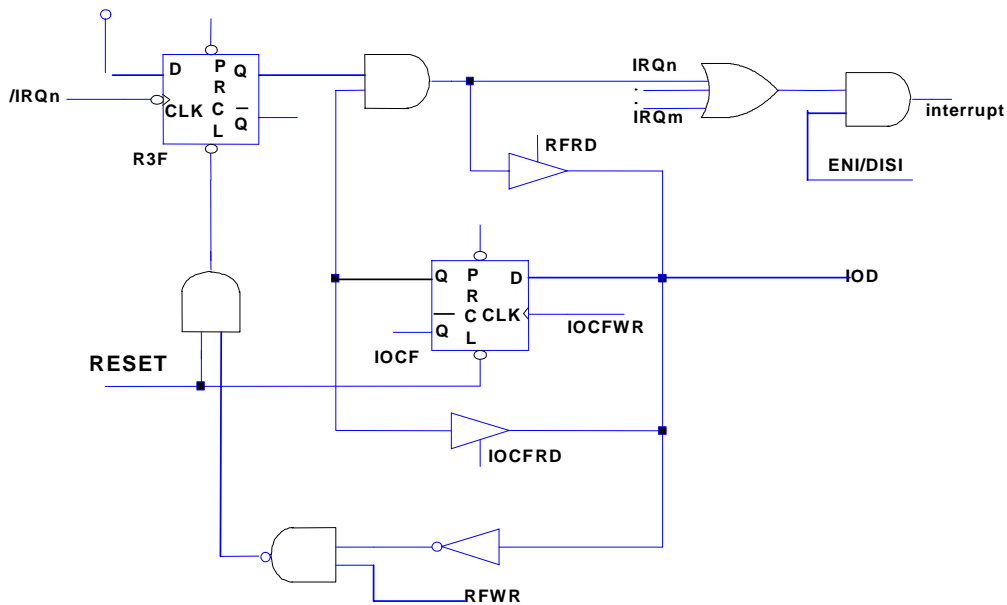

Fig. 17 Interrupt input circuit

4.9 Oscillator

4.9.1 Oscillator Modes

The EM78451 can operate in four different oscillator modes. There are high XTAL (HXT) oscillator mode, low XTAL (LXT) oscillator mode, External RC oscillator mode (ERC), and Internal C   External R oscillator mode. User can select one of them by programming MS, RCT, IRC, HLF and HLP in the Code Option Register. Table 9 depicts how these three modes are defined.

Table 9 Oscillator Modes by MS, RCT.

Mode	MS	RCT	HLF
High XTAL Oscillator	1	X	1
Low XTAL Oscillator	1	X	0
External RC Oscillator	0	1	X
External R and Internal C Oscillator	0	0	X

4.9.2 Crystal Oscillator/Ceramic Resonators (XTAL)

EM78451 can be driven by an external clock signal through the OSCI pin as shown in Fig 18. In most applications, pin OSCI and pin OSCO is connected with a crystal or ceramic resonator to generate oscillation. Fig 19 depicts such circuit. Table 10 provides the recommends values of C1 and C2. Since each resonator has its own attribute, user should refer to its specification for appropriate values of C1 and C2. RS, a serial resistor may be necessary for AT strip cut crystal or low frequency mode.

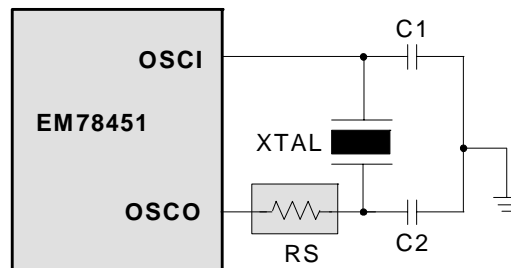

Fig. 18 Circuit for External Clock Input

Fig. 19 Circuit for Crystal/Resonator

(This specification is subject to change without further notice)

Table 10   Capacitor Selection Guide for Crystal Oscillator Ceramic Resonators

Oscillator Type	Frequency Mode	Frequency	C1 (pF)	C2 (pF)
Ceramic Resonator	HXT	455 KHz	10~150	10~150
		1.0 MHz	40~80	40~80
		2.0 MHz	20~40	20~40
		4.0 MHz	10~30	10~30
Crystal Oscillator	LXT	32.768 KHz	25	15
		100 KHz	25	25
		200 KHz	25	25
	HXT	455 KHz	20~40	20~150
		1.0 MHz	15~30	15~30
		2.0 MHz	15	15
		4.0 MHz	15	15
Fig. 20 Circuit for Crystal/Resonator-Series Mode
Fig. 21 Circuit for Crystal/Resonator-Parallel Mode

4.9.3 RC Oscillator Mode

For some applications that do not need a very precise timing calculation, the RC oscillator (Fig. 22 & Fig. 23) offers cost-effective savings. Nevertheless, it should be noted that the frequency of the RC oscillator is influenced by the supply voltage, the values of the resistor (Rext), the capacitor (Cext), and even by the operation temperature. Moreover, the frequency also changes slightly from one chip to another due to the manufacturing process variation.

In order to maintain a stable system frequency, the values of the Cext should not be less than 20pF, and that the value of Rext should not be greater than 1 M ohm. If they cannot be kept in this range, the frequency is easily affected by noise, humidity, and leakage.

The smaller the Rext in the RC oscillator, the faster its frequency will be. On the contrary, for very low Rext values, for instance, 1 KΩ, the oscillator becomes unstable because the NMOS cannot properly discharge the current of the capacitor.

Based on the above reasons, it must be kept in mind that all of the supply voltage, the operation temperature, the components of the RC oscillator, the package types, and the way the PCB is layout, will affect the system frequency.
Fig. 22 Circuit for External RC Oscillator Mode
Fig. 23 Circuit for External R, Internal C Oscillator Mode

Calibrate frequency of External RC oscillator (For reference only)

C ext	R ext	Fosc @5.0V,25
20pF	3.3K	3.4MHz
	5.1K	2.2MHz
	10K	1.3MHz
	100K	144KHz
100pF	3.3K	1.39MHz
	5.1K	935KHz
	10K	500KHz
	100K	54.5KHz
300pF	3.3K	740KHz
	5.1K	490KHz
	10K	255KHz
	100K	28KHz

4.10 Code Option Register

0	1	2	3	4	5	6
ENWDT	MS	HLF	-	RCT	DEL1	DEL0

Bit 0 (ENWDT): Watchdog Timer control.

1: Enable

0: Disable

Bit 1 (MS): Oscillator type.

1: XTAL type

0: RC type

Bit 2 (HLF): Frequency mode.

> 1: High frequency (>32.768KHz)

> 0: Low frequency (=32.768KHz)

Bit 3 : Reserved.

> The bit0 set to "1" all the time

Bit 4 (RCT): RC type.

> 1: External RC

> 0: Internal RC

Bit 5 (DEL1) and Bit 6 (DEL0): Speed of SPI.

DEL 1	DEL 0	Speed (MHz)	Delay time (ns)	Use Type
0	0	8	0 ns	Not use SPI mode
0	1	2.5	50 ns	
1	0	1	100 ns	
1	1	Not use		Not use

*Do not set DEL1 and DEL0 bits to all "1", otherwise, the microprocessor will not work.

The test code of EM78451

The following program must be added in order to heighten the liability of the mass production. The test code must not be executed during free running.

Address	Code	Statement
FFA	0006	IOW 0x06
FFB	0546	INC 0x06
FFC	01C6	DEC 0x06
FFD	01C5	DEC 0x05
FFE	0000	NOP

4.11 Instruction Set

Each instruction in the instruction set is a 13-bit word divided into an OP code and one or more operands. All instructions are executed within one single instruction cycle (consisting of 2 oscillator periods), unless the program counter is changed by:

(a) Executing the instruction "MOV R2,A", "ADD R2,A", "TBL", or any other instructions that write to R2 (e.g. "SUB R2,A", "BS R2,6", "CLR R2", ····).

(b) Executing CALL, RET, RETI, RETL, JMP, Conditional skip (JBS, JBC, JZ, JZA, DJZ, DJZA) which were tested to be true.

Under these cases, the execution takes two instruction cycles.

In addition, the instruction set has the following features:

(1). Every bit of any register can be set, cleared, or tested directly.

(2). The I/O register can be regarded as general register. That is, the same instruction can operate on I/O register.

The symbol "R" represents a register designator that specifies which one of the registers (including operational registers and general purpose registers) is to be utilized by the instruction. Bits 6 and 7 in R4 determine the selected register bank. "b" represents a bit field designator that selects the value for the bit, located in the register "R" and affects by the operation. "k" represents an 8 or 10-bit constant or literal value.
