# OKI Semiconductor 

## 132-Channel LCD Driver with Built-in RAM for LCD Dot Matrix Displays

## GENERAL DESCRIPTION

The ML9058 is an LSI for dot matrix graphic LCD devices carrying out bit map display. This LSI can drive a dot matrix graphic LCD display panel under the control of an 8 -bit microcomputer (hereinafter described MPU). Since all the functions necessary for driving a bit map type LCD device are incorporated in a single chip, using the ML9058 makes it possible to realize a bit map type dot matrix graphic LCD display system with only a few chips. Since the bit map method in which one bit of display RAM data turns ON or OFF one dot in the display panel, it is possible to carry out displays with a high degree of freedom such as Chinese character displays, etc. With one chip, it is possible to construct a graphic display system with a maximum of $65 \times 132$ dots. The display can be expanded further using two chips. However, the ML9058 is not used in a multiple chip configuration when a line reversal drive is set.
The ML9058 is made using a CMOS process. Because it has a built-in RAM, low power consumption is one of its features, and is therefore suitable for displays in battery-operated portable equipment.
The ML9058 has 65 common signal outputs and 132 segment signal outputs and one chip can drive a display of up to $65 \times 132$ dots.

## FEATURES

- Direct display of the RAM data using the bit map method Display RAM data " 1 " ... Dot is displayed
Display RAM data " 0 " ... Dot is not displayed (during forward display)
- Display RAM capacity
$65 \times 132=8580$ bits
- LCD Drive circuits

65 common outputs, 132 segment outputs

- MPU interface: Can select an 8-bit parallel or serial interface
- Built-in voltage multiplier circuit for the LCD drive power supply
- Built-in LCD drive voltage adjustment circuit
- Built-in LCD drive bias generator circuit
- Can select frame reversal drive or line reversal drive by command
- Built-in oscillator circuit (Internal RC oscillator/external clock input)
- A variety of commands

Read/write of display data, display ON/OFF, forward/reverse display, all dots ON/all dots OFF, set page address, set display start address, etc.

- Power supply voltage

Logic power supply: $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{SS}}=3.7 \mathrm{~V}$ to 5.5 V
Voltage multiplier reference voltage: $\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{SS}}=3.7 \mathrm{~V}$ to 5.5 V
(2- to 4-time multiplier available)
LCD Drive voltage: $\mathrm{V}_{\mathrm{BI}}-\mathrm{V}_{\mathrm{SS}}=6.0$ to 18 V

- Package: Gold bump chip (Bump hardness: Low, DV)
: Gold bump chip (Bump hardness: High, CV)
- This device is not resistant to radiation and light.

## BLOCK DIAGRAM

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Condition | Rated value | Unit | Applicable pins |
| :--- | :---: | :---: | :---: | :---: | :---: |
| 0 V |  |  |  |  |  |
| Power supply voltage | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{Tj}=25^{\circ} \mathrm{C}$ | -0.3 to +6.5 | V | $\mathrm{~V}_{\mathrm{DD}}$ |
| Bias voltage | $\mathrm{V}_{\mathrm{BI}}$ | $\mathrm{Tj}=25^{\circ} \mathrm{C}$ | -0.3 to +20 | V | V 1 to V 5 |
| Voltage multiplier output <br> voltage | $\mathrm{V}_{\text {ouT }}$ | $\mathrm{Tj}=25^{\circ} \mathrm{C}$ | -0.3 to +20 | V | $\mathrm{~V}_{\text {out }}$ |
| Voltage multiplier reference <br> voltage | $\mathrm{V}_{\text {IN }}$ | 2-time multiplication <br> 3-time multiplication <br> 4-time multiplication | -0.3 to +5.5 <br> -0.3 to +5.5 <br> -0.3 to +5.0 | V | $\mathrm{~V}_{\text {IN }}$ |
| Input voltage | $\mathrm{V}_{\mathrm{I}}$ | $\mathrm{Tj}=25^{\circ} \mathrm{C}$ | -0.3 to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V | All inputs |
| Storage temperature range | $\mathrm{T}_{\text {STG }}$ | Chip | -55 to +125 | ${ }^{\circ} \mathrm{C}$ | - |

Tj:Chip surface temperature

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Condition | Rated value | Unit | Applicable pins |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Power supply voltage | $\mathrm{V}_{\mathrm{DD}}$ | - | 3.7 to 5.5 | V | $\mathrm{~V}_{\mathrm{DD}}$ |
| Bias voltage | $\mathrm{V}_{\mathrm{BI}}$ | - | 6 to 18 | V | V 1 to V 5 |
| Voltage multiplier reference <br> voltage | $\mathrm{V}_{\text {IN }}$ | 2-time multiplication <br> 3-time multiplication <br> 4-time multiplication | 3.7 to 5.5 <br> 3.7 to 5.5 <br> 3.7 to 4.5 | V | $\mathrm{~V}_{\text {IN }}$ |
| Voltage multiplier output <br> voltage | $\mathrm{V}_{\text {OUT }}$ | External input | 6.0 to 18 | V | $\mathrm{~V}_{\text {OUT }}$ |
| Operating temperature range | $\mathrm{T}_{\text {JOP }}$ | - | -40 to +85 | ${ }^{\circ} \mathrm{C}$ | - |

Note 1: The electrical characteristics are influenced by COG trace resistance. This LSI always has to be evaluated before using.

Note 2: The voltages $\mathrm{V}_{\mathrm{DD}}, \mathrm{V} 1$ to V 5 , and $\mathrm{V}_{\text {OUT }}$ are values taking $\mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V}$ as the reference.
Note 3: The highest bias potential is V 1 and the lowest is $\mathrm{V}_{\mathrm{Ss}}$.
Note 4: Always maintain the relationship $\mathrm{V} 1 \geq \mathrm{V} 2 \geq \mathrm{V} 3 \geq \mathrm{V} 4 \geq \mathrm{V} 5 \geq \mathrm{V}$ ss among these voltages.

Note 5: When using an external power supply, follow the procedure for power application.
When applying external power to the $\mathrm{V}_{\text {OUT }}$ pin only, apply $\mathrm{V}_{\text {OUT }}$ after $\mathrm{V}_{\mathrm{DD}}$.
When applying external power to the V 1 pin only, apply V 1 after $\mathrm{V}_{\mathrm{DD}}$.
When applying external power to the V 1 pin to V 5 pin, apply V 1 to V 5 after $\mathrm{V}_{\mathrm{DD}}$.
Note that the above (Note 4) must be satisfied including transient state at power application.
Note 6: When using an external power supply, follow the procedure for power removal described below.
When external power is in use for the $\mathrm{V}_{\text {OUt }}$ pin only, remove $\mathrm{V}_{\text {OUt }}$ after $\mathrm{V}_{\mathrm{DD}}$.
When external power is in use for the V 1 pin only, remove V 1 after $\mathrm{V}_{\mathrm{DD}}$.
When external power is in use for the V 1 pin to V 5 pin, remove V 1 to V 5 after $\mathrm{V}_{\mathrm{DD}}$.
Note that the above (Note 4) must be satisfied including transient state at power removal.

## ELECTRICAL CHARACTERISTICS

## DC Characteristics

| Parameter |  | $\left[\mathrm{V}\right.$ SS $=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD}}=3.7$ to $5.5 \mathrm{~V}, \mathrm{Tj}=-40$ to $\left.+85^{\circ} \mathrm{C}\right]$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  |  |  |  | "L" | Disabled | Disabled | Input | Input | Output | Input |

## FUNCTIONAL DESCRIPTION

MPU Interface

| MPU | Read mode | Write mode |
| :---: | :---: | :---: |
| 80-Series | Pin $\overline{\mathrm{RD}}=$ "L" | Pin $\overline{W R}=$ " ${ }^{\text {" }}$ |
| 68-Series | $\begin{gathered} \text { Pin } R / \bar{W}=" H " \\ \text { Pin } E=" H " \end{gathered}$ | $\begin{aligned} & \text { Pin } \mathrm{R} / \overline{\mathrm{W}}=\text { "L" } \\ & \text { Pin } \mathrm{E}=\text { "H" } \end{aligned}$ |

In the case of the 80 -series MPU interface, a command is started by applying a low pulse to the $\overline{\mathrm{RD}}$ pin or the $\overline{\mathrm{WR}}$ pin.
In the case of the 68 -series MPU interface, a command is started by applying a high pulse to the E pin.

- Selection of interface type

The ML9058 carries out data transfer using either the 8-bit bi-directional data bus (DB0 to DB7) or the serial data input line (SI). Either the 8-bit parallel data input or serial data input can be selected as shown in Table 2 by setting the $\mathrm{P} / \overline{\mathrm{S}}$ pin to the "H" or the "L" level.

Table 2 Selection of interface type (parallel/serial)

| $\mathrm{P} / \overline{\mathrm{S}}$ | $\overline{\mathrm{CS} 1}$ | CS 2 | A 0 | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ | C 86 | D 7 | D 6 | DB 0 to $\mathrm{DB5}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H: Parallel input | $\overline{\mathrm{CS1}}$ | CS 2 | A 0 | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ | C 86 | D 7 | D 6 | DB 0 to DB5 |
| L: Serial input | $\overline{\mathrm{CS1}}$ | CS 2 | $\mathrm{A0}$ | - | - | - | SI | SCL | - |

A hyphen (-) indicates that the pin can be tied to the "H" or the "L" level.

- Parallel interface

When the parallel interface is selected, $(\mathrm{P} / \overline{\mathrm{S}}=$ " H " $)$, it is possible to connect this LSI directly to the MPU bus of either an 80 -series MPU or a 68 -series MPU as shown in Table 3. depending on whether the pin C86 is set to "H" or "L".

Table 3 Selection of MPU during parallel interface (80-/68-series)

| C 86 | $\overline{\mathrm{CS} 1}$ | CS2 | A0 | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ | DB 0 to DB7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| H: 68-Series MPU bus | $\overline{\mathrm{CS1}}$ | CS2 | A0 | E | $\mathrm{R} / \overline{\mathrm{W}}$ | DB 0 to DB7 |
| $\mathrm{L}: 80-$ Series MPU bus | $\overline{\mathrm{CS1}}$ | CS2 | A0 | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ | DB 0 to DB7 |

The data bus signals are identified as shown in Table 4 below depending on the combination of the signals A0, $\overline{R D}$ (E), and $\overline{W R}(R / \bar{W})$ of Table 3.

Table 4 Identification of data bus signals during parallel interface

|  | Common | 68-Series | 80-Series |  |
| :--- | :---: | :---: | :---: | :---: |
|  | A 0 | $\mathrm{R} / \overline{\mathrm{W}}$ | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ |
| Display data read | 1 | 1 | 0 | 1 |
| Display data write | 1 | 0 | 1 | 0 |
| Status read | 0 | 1 | 0 | 1 |
| Control data write (command) | 0 | 0 | 1 | 0 |

## Serial Interface

When the serial interface is selected ( $\mathrm{P} / \overline{\mathrm{S}}=$ " L "), the serial data input (SI) and the serial clock input (SCL) can be accepted if the chip is in the active state ( $\overline{\mathrm{CS}}=$ " L " and $\mathrm{CS} 2=$ "H"). The serial interface consists of an 8-bit shift register and a 3-bit counter. The serial data is read in from the serial data input pin in the sequence DB7, DB6, ..., DB0 at the rising edge of the serial clock input, and is converted into parallel data at the rising edge of the 8th serial clock pulse and processed further. The identification of whether the serial data is display data or command is judged based on the A0 input, and the data is treated as display data when A0 is "H" and as command when A0 is "L". The A 0 input is read in and identified at the rising edge of the $(8 \times \mathrm{n})$ th serial clock pulse after the chip has become active. Fig. 1 shows the signal chart of the serial interface. (When the chip is not active, the shift register and the counter are reset to their initial states. No data read out is possible in the case of the serial interface. It is necessary to take sufficient care about wiring termination reflection and external noise in the case of the SCL signal. We recommend verification of operation in an actual unit.)

Fig. 1 Signal chart during serial interface

- Chip select

The ML9058 has the two chip select pins $\overline{\text { CS1 }}$ and CS2, and the MPU interface or the serial interface is enabled only when $\overline{\mathrm{CS} 1}=$ "L" and CS2 $=$ "H". When the chip select signals are in the inactive state, the DB0 to DB7 lines will be in the high impedance state and the inputs $A 0, \overline{R D}$, and $\overline{W R}$ will not be effective. When the serial interface has been selected, the shift register and the counter are reset when the chip select signals are in the inactive state.

- Accessing the display data RAM and the internal registers

Accessing the ML9058 from the MPU side requires merely that the cycle time ( $\mathrm{t}_{\mathrm{CYC}}$ ) be satisfied, and high speed data transfer without requiring any wait time is possible. Also, during the data transfer with the MPU, the ML9058 carries out a type of pipeline processing between LSIs via a bus holder associated with the internal data bus. For example, when the MPU writes data in the display data RAM, the data is temporarily stored in the bus holder, and is then written into the display data RAM before the next data read cycle. Further, when the MPU reads out data in the display data RAM, first a dummy data read cycle is carried out to temporarily store the data in the bus holder which is then placed on the system bus and is read out during the next read cycle. There is a restriction on the read sequence of the display data RAM, which is that the read instruction immediately after setting the address does not read out the data of that address, but that data is output as the data of the address specified during the second data read sequence, and hence care should be taken about this during reading. Therefore, always one dummy read is necessary immediately after setting the address or after a write cycle: (The status read cannot use dummy read cycles.) This relationship is shown in Figs 2(a) and 2(b).

- Data write

Fig. 2(a) Write sequence of display data RAM

- Data read

Fig. 2(b) Read sequence of display data RAM

$$
\begin{array}{r}
\mathrm{Dn}=\text { Data } \\
\mathrm{N}=\text { Address data }
\end{array}
$$

- Busy flag

The busy flag being " 1 " indicates that the ML9058 is carrying out reset operations, and hence no instruction other than a status read instruction is accepted during this period. The busy flag is output at pin DB7 when a status read instruction is executed.

## Display Data RAM

- Display data RAM

This is the RAM storing the dot data for display and has an organization of 65 ( 8 pages $\times 8$ bits +1 ) $\times 132$ bits. It is possible to access any required bit by specifying the page address and the column address. Since the display data DB7 to DB0 from the MPU corresponds to the LCD display in the direction of the common lines as shown in Fig. 3 , there are fewer restrictions during display data transfer when the ML9058 is used in a multiple chip configuration, thereby making it easily possible to realize a display with a high degree of freedom. Also, since the display data RAM read/write from the MPU side is carried out via an I/O buffer, it is done independent of the signal read operation for the LCD drive. Consequently, the display is not affected by flickering, etc., even when the display data RAM is accessed asynchronously during the LCD display operation.

Fig. 3 Relationship between display data RAM and LCD display

- Page address circuit

The page address of the display data RAM is specified using the page address set command as shown in Fig. 4. Specify the page address again when accessing after changing the page. The page address 8 (DB3, DB2, DB1, $\mathrm{DB} 0 \rightarrow 1,0,0,0)$ is the RAM area dedicated to the indicator, and only the display data DB0 is valid in this page.

- Column address circuit

The column address of the display data RAM is specified using the column address set command as shown in Fig. 4. Since the specified column address is incremented (by +1 ) every time a display data read/write command is issued, the MPU can access the display data continuously. Further, the incrementing of the column address is stopped at the column address of 83(H). Since the column address and the page address are independent of each other, it is necessary, for example, to specify separately the new page address and the new column address when changing from column $83(\mathrm{H})$ of page 0 to column $00(\mathrm{H})$ of page 1 . Also, as is shown in Table 5 , it is possible to reverse the correspondence relationship between the display data RAM column address and the segment output using the ADC command (the segment driver direction select command). This reduces the IC placement restrictions at the time of assembling LCD modules.

Table 5 Correspondence relationship between the display data RAM column address and the segment output

| ADC |  | SEGMENT Output |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | SEG0 |  |  | SEG131 |  |
| DB0 $=$ "0" | $0(\mathrm{H})$ | $\rightarrow$ | Column Address | $\rightarrow$ | $83(\mathrm{H})$ |
| DB0 $=$ "1" | $83(\mathrm{H})$ | $\leftarrow$ | Column Address | $\leftarrow$ | $0(\mathrm{H})$ |

- Line address circuit

The line address circuit is used for specifying the line address corresponding to the common output when displaying the contents of the display data RAM as is shown in Fig. 4. Normally, the topmost line in the display is specified using the display start line address set command (COM0 output in the forward display state of the common output, and COM63 output in the reverse display state). The display area is 64 lines in the direction of increasing line address from the specified display start line address. When the indicator-dedicated common output pin (COMS) is selected, data in Line Address $40 \mathrm{H}=$ page 8 and bit 0 is displayed irrespective of the display start line address. COMS selection is 65th in order.
It is possible to carry out screen scrolling by dynamically changing the line address using the display start line address set command.

- Display data latch circuit

The display data latch circuit is a latch for temporarily storing the data from the display data RAM before being output to the LCD drive circuits. Since the commands for selecting forward/reverse display and turning the display ON/OFF control the data in this latch, the data in the display data RAM will not be changed.

## Oscillator Circuit

This is an RC oscillator that generates the display clock. The oscillator circuit is effective only when $M / \bar{S}=$ " $H$ " and also CLS = "H". The oscillations will be stopped when CLS = "L", and the display clock has to be input to the CL pin.

Fig. 4 Display data RAM address map

## Display Timing Generator Circuit

This circuit generates the timing signals for the line address circuit and the display data latch circuit from the display clock. The display data is latched in the display data latch circuit and is output to the segment drive output pins in synchronization with the display clock. This circuit generates the timing signals for the line address circuit and the display data latch circuit from the display clock. The display data is latched in the display data latch circuit and is output to the segment drive output pins in synchronization with the display clock. The read out of the display data to the LCD drive circuits is completely independent of the display data RAM access from the MPU. As a result, there is no bad influence such as flickering on the display even when the display data RAM is accessed asynchronously during the LCD display. Also, the internal common timing and LCD frame reversal (FR) signals are generated by this circuit from the display clock. The drive waveforms of the frame reversal drive method shown in Fig. 5(a) for the LCD drive circuits are generated by this circuit. The drive waveforms of the line reversal drive method shown in Fig. 5(b) are also generated by the command.

Fig. 5(a) Waveforms in the frame reversal drive method

Fig. 5(b) Waveforms in the line reversal drive method
When the ML9058 is used in a multiple chip configuration, it is necessary to supply the slave side display timing signals (FR, CL, and $\overline{\mathrm{DOF}}$ ) from the master side. However, when the line reversal drive is set, the ML9058 is not used in a multiple chip configuration.
The statuses of the signals FR, CL, and $\overline{\text { DOF }}$ are shown in Table 6.

Table 6 Display timing signals in master mode and slave mode

| Operating mode |  | FR | CL | $\overline{\mathrm{DOF}}$ |
| :---: | :--- | :---: | :---: | :---: |
| Master mode $(\mathrm{M} / \overline{\mathrm{S}}=$ "H") | Internal oscillator circuit enabled $(\mathrm{CLS}=\mathrm{H})$ | Output | Output | Output |
|  | Internal oscillator circuit disabled $(\mathrm{CLS}=\mathrm{L})$ | Output | Input | Output |
| Slave mode $(\mathrm{M} / \overline{\mathrm{S}}=$ " $\mathrm{L} ")$ | Internal oscillator circuit disabled $(\mathrm{CLS}=\mathrm{H})$ | Input | Input | Input |
|  | Internal oscillator circuit disabled $(\mathrm{CLS}=\mathrm{L})$ | Input | Input | Input |

Note: During master mode, the oscillator circuit operates from the time the power is applied. The oscillator circuit can be stopped only in the sleep state.

## Common Output State Selection Circuit (see Table 7)

Since the common output scanning directions can be set using the common output state selection command in the ML9058, it is possible to reduce the IC placement restrictions at the time of assembling LCD modules.

Table 7 Common output state settings

| State | Common Scanning direction |
| :---: | :---: |
| Forward Display | COM0 $\rightarrow$ COM63 |
| Reverse Display | COM63 $\rightarrow$ COM0 |

## LCD Drive Circuit

This LSI incorporates 181 sets of multiplexers for the ML9058, that generate 4-level outputs for driving the LCD. These output the LCD drive voltage in accordance with the combination of the display data, common scanning signals, and the FR signal. Fig. 6 shows examples of the segment and common output waveforms in the frame reversal drive method.

## Static Indicator Circuit

The FR pin is connected to one side of the LCD drive electrode of the static indicator and the FRS pin is connected to the other side.
The static indicator display is controlled by a command only independently of other display control commands. The electrode of the static indicator should has a wiring pattern that is distant from the dynamic drive electrode. If the wiring pattern is placed too near to the dynamic drive electrode, the LCD and electrode may be degraded.

Fig. 6 Output waveforms in the frame reversal drive method (FR waveform/common waveform/segment waveform/voltage difference between common and segment)

## Power Supply Circuit

This is the low power consumption type power supply circuit for generating the voltages necessary for driving LCD devices, and consists of voltage multiplier circuits, voltage adjustment circuits, and voltage follower circuits. In the power supply circuit, it is possible to control the ON/OFF of each of the circuits of the voltage multiplier, voltage adjustment circuits, and voltage follower circuits using the power control set command. As a result, it is also possible to use parts of the functions of both the external power supply and the internal power supply. Table 8 shows the functions controlled by the 3-bit data of the power control set command and Table 9 shows a sample combination.

Table 8 Details of functions controlled by the bits of the power control set command

| Control bit | Function controlled by the bit |
| :---: | :--- |
| DB2 | Voltage multiplier circuit control bit |
| DB1 | Voltage adjustment circuit (V1 voltage adjustment circuit) control bit |
| DB0 | Voltage follower circuit (V/F circuit) control bit |

Table 9 Sample combination for reference

| State used | DB2 | DB1 | DB0 | Circuit <br> Voltage <br> multiplier |  |  |  | V <br> Adjustment |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Only the internal power <br> supply is used | 1 | 1 | 1 | $\bigcirc$ | V/F | Voltage <br> input | Voltage <br> multiplier <br> pins *1 |  |
| Only V adjustment and <br> V/F circuits are used | 0 | 1 | 1 | $\times$ | $\bigcirc$ | VIN | Used |  |
| Only V/F circuits are used | 0 | 0 | 1 | $\times$ | $\times$ | $\bigcirc$ | $V_{\text {OUT }}$ | OPEN |
| Only the external power <br> supply is used | 0 | 0 | 0 | $\times$ | $\times$ | $\times$ | V1 | OPEN |

*1: The voltage multiplier pins are the pins VS1-, VS2-, VC3+, VC4+, VC5+, and VC6+. If combinations other than the above are used, normal operation is not guaranteed.

- Voltage multiplier circuits

The connections for 2- to 4-time voltage multiplier circuits are shown below.

Fig. 7 Connection examples for voltage multiplier circuits

The voltage relationships in voltage multiplication are shown in Fig. 8.

Voltage relationship in 3-time multiplication

Voltage relationship in 4-time multiplication

Fig. 8 Voltage relationships in voltage multiplication
*1: $\quad$ The voltage range of $\mathrm{V}_{\mathbb{I N}}$ should be set so that the voltage at the pin $\mathrm{V}_{\text {Out }}$ does not exceed the voltage multiplier output voltage operating range.

- Voltage adjustment circuit

The voltage multiplier output $\mathrm{V}_{\text {OUt }}$ produces the LCD drive voltage V 1 via the voltage adjustment circuit. Since the ML9058 incorporates a high accuracy constant voltage generator, a 64-level electronic potentiometer function, and also resistors for voltage V1 adjustment, it is possible to build a high accuracy voltage adjustment circuit with very few components. In addition, the ML9058 is available with the temperature gradients of a VREG - about $-0.05 \% /{ }^{\circ} \mathrm{C}$.
(a) When the internal resistors for voltage V1 adjustment are used

It is possible to control the LCD power supply voltage V1 and adjust the intensity of LCD display using commands and without needing any external resistors, if the internal voltage V1 adjustment resistors and the electronic potentiometer function are used. The voltage V1 can be obtained by the following equation A-1 in the range of $\mathrm{V} 1<\mathrm{VOUT}$.
$\mathrm{V} 1=(1+(\mathrm{Rb} / \mathrm{Ra})) \bullet \mathrm{VEV}=(1+(\mathrm{Rb} / \mathrm{Ra})) \bullet(1-(\alpha / 324)) \bullet \mathrm{VREG} \quad(E q n . \mathrm{A}-1)$

Fig. 9 V1 voltage adjustment circuit (equivalent circuit)

VREG is a constant voltage generated inside the IC and VRS pin output voltage.
Here, $\alpha$ is the electronic potentiometer function which allows one level among 64 levels to be selected by merely setting the data in the 6 -bit electronic potentiometer register. The values of $\alpha$ set by the electronic potentiometer register are shown in Table 10.

Table 10 Relationship between electronic potentiometer register and $\alpha$

| $\alpha$ | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 63 | 0 | 0 | 0 | 0 | 0 | 0 |
| 62 | 0 | 0 | 0 | 0 | 0 | 1 |
| 61 | 0 | 0 | 0 | 0 | 1 | 0 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 0 | 1 | 1 | 1 | 1 | 1 | 1 |

$\mathrm{Rb} / \mathrm{Ra}$ is the voltage V 1 adjustment internal resistor ratio and can be adjusted to one of 7 levels by the voltage V 1 adjustment internal resistor ratio set command. The reference values of the ratio ( $1+\mathrm{Rb} / \mathrm{Ra}$ ) according to the 3-bit data set in the voltage V1 adjustment internal resistor ratio setting register are listed in Table 11.

Table 11 Voltage V1 adjustment internal resistor ratio setting register values and the ratio (1+Rb/Ra) (Nominal)

| Register |  |  | $(1+\mathrm{Rb} / \mathrm{Ra})$ |
| :---: | :---: | :---: | :---: |
| DB2 | DB1 | DB0 |  |
| 0 | 0 | 0 | 3.0 |
| 0 | 0 | 1 | 3.5 |
| 0 | 1 | 0 | 4.0 |
| 0 | 1 | 1 | 4.5 |
| 1 | 0 | 0 | 5.0 |
| 1 | 0 | 1 | 5.5 |
| 1 | 1 | 0 | 6.0 |

Note: Use V1 gain in the range from 3 to 6 times. Because this LSI has temperature gradient, V1 voltage rises at lower temperatures. When using V1 gain of 6 times, adjust the built-in electronic potentiometer so that V 1 voltage does not exceed 18 V .

When V1 is set using the built-in resistance ratio, the accuracies are shown in Table 12.
Table 12 Relation between V1 Output Voltage Accuracy and V1 Gain Using Built-in Resistor

| Parameter | V1 gain |  |  |  |  |  | Unit |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 times | 3.5 times | 4 times | 4.5 times | 5 times | 5.5 times |  |  |
| V1 output voltage accuracy | $\pm 2.5$ | $\pm 2.5$ | $\pm 2.5$ | $\pm 2.5$ | $\pm 2.5$ | $\pm 2.5$ | $\pm 2.5$ | $\%$ |
| V1 maximum output voltage | 9 | 10.5 | 12 | 13.5 | 15 | 16.5 | 18 | V |

Note: The V1 maximum output voltages in Table 12 are nominal values when $\mathrm{Tj}=25^{\circ} \mathrm{C}$, and electronic potentiometer $\alpha=0$. The V1 output voltage accuracy in Table 12 are values when V 1 load current $\mathrm{I}=0 \mu \mathrm{~A}, 20 \mathrm{~V}$ is externally input to $\mathrm{V}_{\text {out }}$, and display is turned OFF.
(b) When external resistors are used (voltage V1 adjustment internal resistors are not used)

It is also possible to set the LCD drive power supply voltage V1 without using the internal resistors for voltage V1 adjustment but connecting external resistors ( $\mathrm{Ra}^{\prime}$ and $\mathrm{Rb}^{\prime}$ ) between $\mathrm{V}_{\text {SS }} \& ~ V R$ and between VR \& V1. Even in this case, it is possible to control the LCD power supply voltage V1 and adjust the intensity of LCD display using commands if the electronic potentiometer function is used.
The voltage V 1 can be obtained by the following equation $\mathrm{B}-1$ in the range of $\mathrm{V} 1<\mathrm{V}_{\text {OUt }}$ by setting the external resistors $\mathrm{Ra}^{\prime}$ and $\mathrm{Rb}^{\prime}$ appropriately.
$\mathrm{V} 1=\left(1+\left(\mathrm{Rb}^{\prime} / \mathrm{Ra}^{\prime}\right)\right) \bullet \mathrm{VEV}=\left(1+\left(\mathrm{Rb}^{\prime} / \mathrm{Ra}^{\prime}\right)\right) \bullet(1-(\alpha / 324)) \bullet$ VREG $\quad(E q n . \mathrm{B}-1)$

Fig. 10 V1 voltage adjustment circuit (equivalent circuit)

Setting example: Setting V1 $=7 \mathrm{~V}$ at $\mathrm{Tj}=25^{\circ} \mathrm{C}$
When the electronic potentiometer register value is set to the middle value of (DB5, DB4, DB3, DB2, DB1, DB0) $=(1,0,0,0,0,0)$, the value of $\alpha$ will be 31 and that of VREG will be 3.0 V , and hence the equation $\mathrm{B}-1$ becomes as follows:
$\mathrm{V} 1=\left(1+\left(\mathrm{Rb}^{\prime} / \mathrm{Ra}^{\prime}\right)\right) \bullet(1-(\alpha / 324)) \cdot \mathrm{VREG}$
$7=\left(1+\left(\mathrm{Rb}^{\prime} / \mathrm{Ra}^{\prime}\right)\right) \bullet(1-(31 / 324)) \bullet 3.0 \quad$ (Eqn. B-2)
Further, if the current flowing through $R a^{\prime}$ and $R b^{\prime}$ is set as $5 \mu \mathrm{~A}$, the value of $R a^{\prime}+R b^{\prime}$ will be $-\mathrm{Ra}^{\prime}+\mathrm{Rb}^{\prime}=1.4$ $\mathrm{M} \Omega$ (Eqn. B-3)
and hence,
$\mathrm{Rb}^{\prime} / \mathrm{Ra}^{\prime}=1.58, \mathrm{Ra}^{\prime}=543 \mathrm{k} \Omega, \mathrm{Rb}^{\prime}=857 \mathrm{k} \Omega$.
In this case, the variability range of voltage V1 using the electronic potentiometer function will be as given in Table 13.

Table 13 Example 1 of V1 variable-voltage range using electronic potentiometer function

| V1 | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Variable-voltage range | $6.24(\alpha=63)$ | $7.0(\alpha=31)$ | $7.74(\alpha=0)$ | $[V]$ |

(c) When external resistors are used (voltage V1 adjustment internal resistors are not used) and a variable resistor is also used
It is possible to set the LCD drive power supply voltage V1 using fine adjustment of Ra' and Rb' by adding a variable resistor to the case of using external resistors in the above case. Even in this case, it is possible to control the LCD power supply voltage V1 and adjust the intensity of LCD display using commands if the electronic potentiometer function is used.
The voltage V 1 can be obtained by the following equation $\mathrm{C}-1$ in the range of $\mathrm{V} 1<\mathrm{V}_{\text {OUt }}$ by setting the external resistors $R_{1}, R_{2}$ (variable resistor), and $R_{3}$ appropriately and making fine adjustment of $R_{2}\left(\Delta R_{2}\right)$.
$\mathrm{V} 1=\left(1+\left(\mathrm{R}_{3}+\mathrm{R}_{2}-\Delta \mathrm{R}_{2}\right) /\left(\mathrm{R}_{1}+\Delta \mathrm{R}_{2}\right)\right) \cdot \mathrm{VEV}$
$=\left(1+\left(\mathrm{R}_{3}+\mathrm{R}_{2}-\Delta \mathrm{R}_{2}\right) /\left(\mathrm{R}_{1}+\Delta \mathrm{R}_{2}\right)\right) \bullet(1-(\alpha / 324)) \bullet$ VREG $\quad$ (Eqn. C-1)

Fig. 11 V1 voltage adjustment circuit (equivalent circuit)
Setting example: Setting V1 in the range 5 V to 9 V using $\mathrm{R}_{2}$ at $\mathrm{Tj}=25^{\circ} \mathrm{C}$.
When the electronic potentiometer register value is set to (DB5, DB4, DB3, $\mathrm{DB} 2, \mathrm{DB} 1, \mathrm{DB} 0)=(1,0,0,0,0,0)$, the value of $\alpha$ will be 31 and that of VREG will be 3.0 V , and hence in order to make $\mathrm{V} 1=9 \mathrm{~V}$ when $\Delta \mathrm{R}_{2}=0 \Omega$, the equation $\mathrm{C}-1$ becomes as follows:
$9=\left(1+\left(\mathrm{R}_{3}+\mathrm{R}_{2}\right) / \mathrm{R}_{1}\right) \bullet(1-(31 / 324)) \bullet(3.0)$ (Eqn. $\left.\mathrm{C}-2\right)$
In order to make $\mathrm{V} 1=5 \mathrm{~V}$ when $\Delta \mathrm{R}_{2}=\mathrm{R}_{2}$,
$5=\left(1+\mathrm{R}_{3} /\left(\mathrm{R}_{1}+\mathrm{R}_{2}\right)\right) \bullet(1-(31 / 324)) \bullet(3.0)$ (Eqn. $\left.\mathrm{C}-3\right)$
Further, if the current flowing between $V_{S S}$ and $V 1$ is set as $5 \mu A$, the value of $R_{1}+R_{2}+R_{3}$ becomes-
$\mathrm{R}_{1}+\mathrm{R}_{2}+\mathrm{R}_{3}=1.8 \mathrm{M} \Omega$ (Eqn. C-4)
and hence,
$\mathrm{R}_{1}=542 \mathrm{k} \Omega, \mathrm{R}_{2}=436 \mathrm{k} \Omega, \mathrm{R}_{3}=822 \mathrm{k} \Omega$.
In this case, the variability range of voltage V1 using the electronic potentiometer function and the increment size will be as given in Table 14.

Table 14 Example 2 of V1 variable-voltage range using electronic potentiometer function and variable resistor

| V1 | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Variable-voltage range | $4.45(\alpha=63)$ | $7.0(\alpha=31)$ | $9.96(\alpha=0)$ | $[\mathrm{V}]$ |

In Figures 10 and 11, the voltage VEV is obtained by the following equation by setting the electronic potentiometer between 0 and 63 .

VEV $=(1-(\alpha / 324)) \bullet$ VREG
$\alpha=0: \quad \mathrm{VEV}=(1-(0 / 324)) \cdot 3.0 \mathrm{~V}=3.0 \mathrm{~V}$
$\alpha=31: \operatorname{VEV}=(1-(31 / 324)) \cdot 3.0 \mathrm{~V}=2.712 \mathrm{~V}$
$\alpha=63: \operatorname{VEV}=(1-(63 / 324)) \cdot 3.0 \mathrm{~V}=2.416 \mathrm{~V}$
The increment size of the electronic potentiometer at VEV when VREG $=3.0$ is :
$\Delta=\frac{3.0-2.416}{63}=9.27 \mathrm{mV}($ Nominal $)$

When $\mathrm{VREG}=3.069 \mathrm{~V}, \alpha=0: \mathrm{VEV}=3.069 \mathrm{~V}, \alpha=63: \mathrm{VEV}=2.472 \mathrm{~V}$
The increment size is :
$\Delta=\frac{3.069 \mathrm{~V}-2.472 \mathrm{~V}}{63}=9.476 \mathrm{mV}$
When $\mathrm{VREG}=2.931 \mathrm{~V}, \alpha=0: \mathrm{VEV}=2.931 \mathrm{~V}, \alpha=63: \mathrm{VEV}=2.361 \mathrm{~V}$
The increment size is :
$\Delta=\frac{2.931 \mathrm{~V}-2.361 \mathrm{~V}}{63}=9.047 \mathrm{mV}$

* When using the voltage V1 adjustment internal resistors or the electronic potentiometer function, it is necessary to set at least the voltage adjustment circuit and the voltage follower circuits both in the operating state using the power control setting command. Also, when the voltage multiplier circuit is OFF, it is necessary to supply a voltage externally to the $\mathrm{V}_{\text {Out }}$ pin.
* The pin VR is effective only when the voltage V1 adjustment internal resistors are not used (pin IRS = "L"). Leave this pin open when the voltage V1 adjustment internal resistors are being used (pin IRS = " H ").
* Since the input impedance of the pin VR is high, it is necessary to take noise countermeasures such as using short wiring length or a shielded wire .
* The supply current increases in proportion to the panel capacitance. When power consumption increases, the $\mathrm{V}_{\text {Out }}$ level may fall. The voltage $\left(\mathrm{V}_{\text {OUT }}-\mathrm{V} 1\right)$ should be more than 3 V .
- LCD Drive voltage generator circuits

The voltage V1 is divided using resistors inside the IC to generate the voltages V2, V3, V4, and V5 that are necessary for driving the LCD. In addition, these voltages V2, V3, V4, and V5 are impedance transformed using voltage follower circuits and fed to the LCD drive circuits. The bias ratio of $1 / 9$ or $1 / 7$ can be selected using the LCD bias setting command.

- At built-in power-on, and transition from power save state to display mode

After built-in power-on, at the command " $2 \mathrm{~F}(\mathrm{H})$ " input, or on transition from power save state to display mode, the display does not operate for a maximum period of 300 ms until the built-in power is stabilized. This period of no display is not influenced by display ON/OFF command. Despite input of display ON command during this period, the display does not operate for this period. However, the command is valid. After the wait time is finished, the display operates. (During this period of no display, all commands are acceptable.)

- Command sequence for shutting off the internal power supply

When shutting off the internal power supply, it is recommended to use the procedure given in Fig. 12 of switching OFF the power after putting the LSI in the power save state using the following command sequence.

Fig. 12 Command sequence for shutting off the internal power supply

- Application circuits
(Two V1 pins are described in the following examples for explanation, but they are the same.)

| (3) When only the voltage adjustment circuit and V/F circuits are used | (4) When only the voltage adjustment circuit and V/F circuits are used |
| :---: | :---: |
| When not using the internal voltage V1 adjustment resistors | When using the internal voltage V1 adjustment resistors |
|  |  |

Note: When trace resistance external to COG-mounted chip does not exist,
(1) when $\mathrm{C} 1\left({ }^{*} 1\right)=0.9 \mu \mathrm{~F}$ to $5.7 \mu \mathrm{~F}, \mathrm{C} 2\left({ }^{*} 2\right)=0.42 \mu \mathrm{~F}$ to $1.2 \mu \mathrm{~F}$, use in the range Rall $(* 3)=1 \mathrm{M} \Omega$ to $5 \mathrm{M} \Omega$.
(2) when $\mathrm{C} 1\left({ }^{*} 1\right)=1.8 \mu \mathrm{~F}$ to $5.7 \mu \mathrm{~F}, \mathrm{C} 2\left({ }^{*} 2\right)=0.42 \mu \mathrm{~F}$ to $1.2 \mu \mathrm{~F}$,
use in the range Rall ( $* 3$ ) $=500 \mathrm{k} \Omega$ to $1 \mathrm{M} \Omega$.
Make sure that voltage multiplier output voltage, and V1 output voltage have enough margin before using this LSI.

- Initial setting

Note: If electric charge remains in smoothing capacitor connected between the LCD driver voltage output pins (V1 to V 5 ) and the $\mathrm{V}_{\text {SS }}$ pin, a malfunction might occur: the display screen gets dark for an instant when powered on.
To avoid a malfunction at power-on, it is recommended to follow the flowchart in the "EXAMPLES OF SETTINGS FOR THE INSTRUCTIONS" section in page 54.

## LIST OF OPERATION

| No | Operation |  | DBn | A0 | $\overline{\mathrm{RD}}$ | $\overline{W R}$ | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 76543210 |  |  |  |  |
| 1 | Display OFF |  | 10101110 | 0 | 1 | 0 | LCD Display: OFF when DB0 $=0 \mathrm{ON}$ when $\mathrm{DB} 0=1$ |

Note 1: When the line reversal drive is set, the ML9058 is not used in a multiple chip configuration.

## DESCRIPTIONS OF OPERATION

## Display ON/OFF (Write)

This is the command for controlling the turning on or off the LCD panel. The LCD display is turned on when a " 1 " is written in bit DB0 and is turned off when a " 0 " is written in this bit.

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Display ON | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 |
| Display OFF | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 0 |

## Display start line set (Write)

This command specifies the display starting line address in the display data RAM.
Normally, the topmost line in the display is specified using the display start line set command.
It is possible to scroll the display screen by dynamically changing the address using the display start line set command.

| Line address | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 62 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 63 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

## Page address set (Write)

This command specifies the page address which corresponds to the lower address when accessing the display data RAM from the MPU side.
It is possible to access any required bit in the display data RAM by specifying the page address and the column address.

| Page address | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 |
| 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| 2 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 7 | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 1 | 1 |
| 8 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 |

Note: Do not specify values that do not exist as an address.

## Column address set (Write)

This command specifies the column address of the display data RAM. The column address is specified by successively writing the upper 4 bits and the lower 4 bits. Since the column address is automatically incremented (by +1 ) every time the display data RAM is accessed, the MPU can read or write the display data continuously. The incrementing of the column address is stopped at the address 83(H).

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Upper bits | 0 | 0 | 0 | 0 | 1 | a7 | a6 | a5 | a4 |
| Lower bits | 0 | 0 | 0 | 0 | 0 | a3 | a2 | a1 | a0 |

| Column address | a7 | a6 | a5 | a4 | a3 | a2 | a1 | a0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 130 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| 131 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

Note: Do not specify values that do not exist as an address.

## Status read (Read)

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | BUSY | ADC | ON/OFF | RESET | $*$ | $*$ | $*$ | $*$ |

*: Invalid data

| BUSY | When BUSY is '1', it indicates that the internal operations are being made or the LSI is <br> being reset. Although no command is accepted until BUSY becomes ' 0 ', there is no <br> need to check this bit if the cycle time can be satisfied. |
| :---: | :--- |
| ADC | This bit indicates the relationship between the column address and the segment driver. <br> $0:$ Reverse (SEG131 $\rightarrow$ SEGO); column address $0(\mathrm{H}) \rightarrow 83(\mathrm{H})$ <br> 1: Forward (SEG0 $\rightarrow$ SEG131); column address $0(\mathrm{H}) \rightarrow 83(\mathrm{H})$ <br> (Opposite to the polarity of the ADC command.) |
| ON/OFF | This bit indicates the ON/OFF state of the display. (Opposite to the polarity of the <br> display ON/OFF command.) <br> $0:$ Display ON <br> 1: Display OFF |
| RESET | This bit indicates that the LSI is being reset due to the $\overline{\text { RES signal or the reset }}$ <br> command. <br> 0: Operating state <br> 1: Being reset |

## Display data write (Write)

This command writes an 8-bit data at the specified address of the display data RAM. Since the column address is automatically incremented $(b y+1)$ after writing the data, the MPU can write successive display data to the display data RAM.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Write data |  |  |  |  |  |  |  |

## Display data read (Read)

This command read the 8-bit data from the specified address of the display data RAM. Since the column address is automatically incremented $(b y+1)$ after reading the data, the MPU can read successive display data from the display data RAM. Further, one dummy read operation is necessary immediately after setting the column data. The display data cannot be read out when the serial interface is being used.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Read data |  |  |  |  |  |  |  |

## ADC select (segment driver direction select) (Write)

Using this command it is possible to reverse the relationship of correspondence between the column address of the display data RAM and the segment driver output. It is possible to reverse the sequence of the segment driver output pin by the command.

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Forward | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| Reverse | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |

## Forward/reverse display mode (Write)

It is possible to toggle the display on and off condition without changing the contents of the display data RAM. In this case, the contents of the display data RAM will be retained.

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 | RAM Data |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| Forward | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | Display on when "H" |
| Reverse | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | Display on when "L" |

## LCD display all-on ON/OFF (Write)

Using this command, it is possible to forcibly turn ON all the dots in the display irrespective of the contents of the display data RAM. In this case, the contents of the display data RAM will be retained.
This command is given priority over the Forward/reverse display mode command.

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All-on display OFF | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| (Normal display) | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |
| All-on display ON | 0 | 1 | 0 | 0 | 0 |  |  |  |  |

The power save mode will be entered into when the Display all-on ON command is executed in the display OFF condition.

## LCD bias set (Write)

This command is used for selecting the bias ratio of the voltage necessary for driving the LCD device or panel.

| LCD bias | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1 / 9$ bias | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| $1 / 7$ bias | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |

## Read modify write (Write)

This command is used in combination with the End command. When this command is issued once, the column address is not changed when the Display data read command is issued, but is incremented (by +1 ) only when the Display data write command is issued. This condition is maintained until the End command is issued. When the End command is issued, the column address is restored to the address that was effective at the time the Read-modify-write command was issued last. Using this function, it is possible to reduce the overhead on the MPU when repeatedly changing the data in special display area such as a blinking cursor.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |

## End (Write)

This command releases the read-modify-write mode and restores the column address to the value at the beginning of the mode.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 |

## Reset (Write)

This command initializes the display start line number, column address, page address, common output state, voltage V1 adjustment internal resistor ratio, electronic potentiometer function, and the static indicator function, and also releases the read-modify-write mode or the test mode. This command does not affect the contents of the display data RAM.
The reset operation is made after issuing the reset command.
The initialization after switching on the power is carried out by the reset signal input to the $\overline{\mathrm{RES}}$ pin.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |

## Common output state select (Write)

This command is used for selecting the scanning direction of the common output pins.

|  | Scanning direction | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Forward | COM0 $\rightarrow$ COM63 | 0 | 1 | 1 | 0 | 0 | 0 | $*$ | $*$ | $*$ |
| Reverse | COM63 $\rightarrow$ COM0 | 0 | 1 | 1 | 0 | 0 | 1 | $*$ | $*$ | $*$ |

[^0]
## Power control set (Write)

This command set the functions of the power supply circuits.

|  | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Voltage multiplier circuit: OFF | 0 | 0 | 0 | 1 | 0 | 1 | 0 |  |  |
| Voltage multiplier circuit: ON | 0 | 0 | 0 | 1 | 0 | 1 | 1 |  |  |
| Voltage adjustment circuit: OFF | 0 | 0 | 0 | 1 | 0 | 1 |  | 0 |  |
| Voltage adjustment circuit: ON | 0 | 0 | 0 | 1 | 0 | 1 |  | 1 |  |
| Voltage follower circuits: OFF | 0 | 0 | 0 | 1 | 0 | 1 |  |  | 0 |
| Voltage follower circuits: ON | 0 | 0 | 0 | 1 | 0 | 1 |  |  | 1 |

## Voltage V1 adjustment internal resistor ratio set

This command sets the ratios of the internal resistors for adjusting the voltage V1.

| Resistor ratio | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3.0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| 3.5 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| 4.0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 4.5 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| 5.0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| 5.5 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |
| 6.0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 |
| Input inhibiting code | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |

Note: Because this LSI has temperature gradient, V1 rises at lower temperatures. When using V1 gain of 6 times, adjust the built-in electronic potentiometer so that V 1 does not exceed 18 V .

## Electronic potentiometer (2-byte command)

This command is used for controlling the LCD drive voltage V1 output by the voltage adjustment circuit of the internal LCD power supply and for adjusting the intensity of the LCD display.
This is a two-byte command consisting of the Electronic potentiometer mode set command and the Electronic potentiometer register set command, both of which should always be issued successively as a pair.

- Electronic potentiometer mode set (Write)

When this command is issued, the electronic potentiometer register set command becomes effective.
Once the electronic potentiometer mode is set, it is not possible to issue any command other than the Electronic potentiometer register set command. This condition is released after data has been set in the register using the Electronic potentiometer register set command.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

- Electronic potentiometer register set (Write)

By setting a 6-bit data in the electronic potentiometer register using this command, it is possible to set the LCD drive voltage V1 to one of the 64 voltage levels.
The electronic potentiometer mode is released after some data has been set in the electronic potentiometer register using this command.

| $\alpha$ | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 63 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 0 | 1 |
| 62 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 0 | 1 |
| 61 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 1 | 0 |
| 60 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 1 | 1 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 1 | $\vdots$ | $\vdots$ | $\vdots$ | 1 | 1 | 1 | 1 | 1 | 0 |
| 0 | 0 | $*$ | $*$ | 1 | 1 | 1 | 1 | 1 | 1 |

*: Invalid data
Set the data $\left({ }^{*},{ }^{*}, 1,0,0,0,0,0\right)$ when not using the electronic potentiometer function.
Sequence of setting the electronic potentiometer register:

## Static indicator (2-byte command)

This command is used for controlling the static drive type indicator display.
Static indicator display is controlled only by this command and is independent of all other display control commands.

Since the Static indicator ON command is a two-byte command used in combination with the static indictor register set command, these two commands should always be used together.
(The Static indicator OFF command is a single byte command.)

- Static indicator ON/OFF (Write)

When the Static indicator ON command is issued, the Static indicator register set command becomes effective. Once the Static indicator ON command is issued, it is not possible to issue any command other than the Static indicator register set command. This condition is released only after some data is written into the register using the static indicator register set command.

| Static indicator | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OFF | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| ON | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 1 |

- Static indicator register set (Write)

This command is used to set data in the 2-bit static indicator register thereby setting the blinking state of the static indicator.

| Indicator | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OFF | 0 | $*$ | $*$ | $*$ | $*$ | $*$ | $*$ | 0 | 0 |
| ON(Blinking at about 1sec intervals) | 0 | $*$ | $*$ | $*$ | $*$ | $*$ | $*$ | 0 | 1 |
| ON(Blinking at about 0.5sec intervals) | 0 | $*$ | $*$ | $*$ | $*$ | $*$ | $*$ | 1 | 0 |
| ON(Continuously ON) | 0 | $*$ | $*$ | $*$ | $*$ | $*$ | $*$ | 1 | 1 |

## *: Invalid data

Sequence of setting the static indicator register:

The static indicator mode is released

## LCD drive method set (Write)

This command sets the LCD drive method.

- Line reversal drive (2-byte command)/frame reversal drive select

Line or frame reversal drive can be selected as the LCD drive method.
When selecting line reversal drive, which is 2-byte command used with line reversal number set command, be sure to use both commands successively.
Once line reversal drive is set, commands other than line reversal number set command cannot be used. This state is released after data is set to the register by line reversal number set command.
The frame reversal set command is a single byte command.

| LCD drive method | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frame reversal | 0 | 1 | 1 | 0 | 1 | 0 | ${ }^{*}$ | ${ }^{*}$ | ${ }^{*}$ |
| Line reversal | 0 | 1 | 1 | 0 | 1 | 1 | ${ }^{*}$ | ${ }^{*}$ | ${ }^{*}$ |

*: Invalid data

- Line reversal number set (Write)

The number of lines is set when the line reversal is set using the LCD drive method set command.

| Number of line reversal | A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | $*$ | $*$ | $*$ | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | $*$ | $*$ | $*$ | 0 | 0 | 0 | 0 | 1 |
| 3 | 0 | $*$ | $*$ | $*$ | 0 | 0 | 0 | 1 | 0 |
| 4 | 0 | $*$ | $*$ | $*$ | 0 | 0 | 0 | 1 | 1 |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| 31 | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | 1 | 1 | 1 | 1 | 0 |
| 32 | 0 | $*$ | $*$ | $*$ | 1 | 1 | 1 | 1 | 1 |

*: Invalid data

Note 1: Because the number of line reversal depends on panel size and panel load capacitance, set the optimum number of lines at the time of ES evaluation.
Note 2: When line reversal drive is used, a multiple chip configuration cannot be achieved.

## Power save (Compound command)

The LSI goes into the power save state when the Display all-on ON command is issued when the LSI is in the display OFF state, and it is possible to greatly reduce the current consumption in this state. The power save state is of two types, namely, the sleep state and the standby state, and the LSI goes into the standby state when the static indicator has been made ON.
The display data and the operating mode just before entering the power save mode are retained in both the sleep state and the standby state, and also the MPU can access the display data RAM and other registers in these states. The power save mode is released by issuing the Display all-on OFF command. (See the following figure.)

- Sleep state

In this state, all the operations of the LCD display system are stopped and it is possible to reduce the current consumption to a level near the idle state current consumption unless there are accesses from the MPU. The internal conditions in the sleep state are as follows:
(1) The oscillator circuit and the LCD power supply are stopped.
(2) All the LCD drive circuits are stopped and the segment and common driver outputs will be at the $\mathrm{V}_{\text {SS }}$ level.

- Standby state

All operations of the dynamic LCD display section are stopped, only the static display circuits for the indicators operate and hence the current consumption will be the minimum necessary for static drive. The internal conditions in the standby state are as follows:
(1) The power supply circuit for LCD drive is stopped. The oscillator circuit will be operating.
(2) The LCD drive circuits for dynamic display are stopped and the segment and common driver outputs will be at the $\mathrm{V}_{\mathrm{SS}}$ level. The static display section will be operating.

Note: When using an external power supply, stop external power supply at power save start-up.
For example, when providing each level of LCD drive voltage with external voltage divider, add a circuit for cutting off current flowing through the resistors of the voltage divider when initiating power save.
The ML9058 has LCD display blanking control pin, $\overline{\mathrm{DOF}}$, which goes "L" at power save start-up. The external power supply can be stopped using $\overline{\mathrm{DOF}}$ output.

## NOP (Write)

This is a No Operation command.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 1 |

## Test (Write)

This is a command for testing the IC chip. Do not use this command. When the test command is issued by mistake, this state can be released by issuing a NOP command.

| A0 | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 1 | 1 | ${ }^{*}$ | ${ }^{*}$ | ${ }^{*}$ | $*$ |

[^1]
## Initialized condition using the $\overline{\operatorname{RES}}$ pin

This LSI goes into the initialized condition when the $\overline{\mathrm{RES}}$ input goes to the "L" level. The initialized condition consists of the following conditions.
(1) Display OFF
(2) Forward display mode
(3) ADC select: Incremented (ADC command $\mathrm{DB} 0=$ "L")
(4) Power control register: $(\mathrm{DB} 2, \mathrm{DB} 1, \mathrm{DB} 0)=(0,0,0)$
(5) The registers and data in the serial interface are cleared.
(6) LCD Power supply bias ratio: $1 / 9$ bias
(7) All display dots OFF
(8) Read-modify-write: OFF
(9) Static indicator: OFF

Static indicator register: $(\mathrm{DB} 1, \mathrm{DB} 0)=(0,0)$
(10) Line 1 is set as the display start line.
(11) The column address is set to address 0 .
(12) The page address is set to 0 .
(13) Common output state: Forward
(14) Voltage V1 adjustment internal resistor ratio register: (DB2, DB1, DB0) $=(1,0,0)$
(15) The electronic potentiometer register set mode is released.

Electronic potentiometer register: (DB5, DB4, DB3, DB2, DB1, DB0) $=(1,0,0,0,0,0)$
(16) The LCD drive method is set to the frame reversal drive.

Line reversal number register: $(\mathrm{DB} 4, \mathrm{DB} 3, \mathrm{DB} 2, \mathrm{DB} 1, \mathrm{DB} 0)=(1,0,0,0,0)$
On the other hand, when the reset command is used, only the conditions (8) to (15) above are set.
As is shown in the "MPU Interface (example for reference)", the $\overline{R E S}$ pin is connected to the Reset pin of the MPU and the initialization of this LSI is made simultaneously with the resetting of the MPU. This LSI always has to be reset using the $\overline{\mathrm{RES}}$ pin at the time the power is switched ON. Also, excessive current can flow through this LSI when the control signal from the MPU is in the high impedance state. It is necessary to take measures to ensure that the input pins of this LSI do not go into the high impedance state after the power has been switched ON. When the built-in LCD drive power supply circuit of the ML9058 is not used, it is necessary that $\overline{R E S}=$ "L" when the external LCD drive power supply goes ON. During the period when $\overline{R E S}=$ "L", although the oscillator circuit is operating, the display timing generator would have stopped and the pins CL, FR, FRS, and $\overline{\operatorname{DOF}}$ would have been tied to the "H" level. There is no effect on the pins DB0 to DB7.

## EXAMPLES OF SETTINGS FOR THE INSTRUCTIONS

## When using the internal power supply immediately after power-on

*(a): Carry out power control set within 5 ms after releasing the reset state.
The 5 ms duration changes depending on the panel characteristics and the value of the smoothing capacitor. We recommend verification of operation using an actual unit.
*(b): When trace resistance in COG mounting does not exist, wait for over 300 ms .
Since this value varies with trace resistance, V1, smoothing capacitors, or voltage multiplier capacitors in COG mounting, confirm operation on an actual circuit board when using this LSI.

## When not using the internal power supply immediately after power-on

*(a): Enter the power save state within 5 ms after releasing the reset state.
*(b): Carry out power control set within 5 ms after releasing the power save state.
The 5 ms duration in *(a) and *(b) changes depending on the panel characteristics and the value of the smoothing capacitor. We recommend verification of operation using an actual unit.
*(c): When trace resistance in COG mounting does not exist, wait for over 300 ms .
Since this value varies with trace resistance, V1, smoothing capacitors, or voltage multiplier capacitors in COG mounting, confirm operation on an actual circuit board when using this LSI.

## Power supply OFF (*15)

## Notes: Sections to be referred to

*15: The power supply of this LSI is switched OFF after switching OFF the internal power supply. Function description "Power supply circuit"
If the power supply of this LSI is switched OFF when the internal power supply is still ON, since the state of supplying power to the built-in LCD drive circuits continues for a short duration, it may affect the display quality of the LCD panel. Always follow the power supply switching OFF sequence.
*16: Description of operation "Power save"

## Refresh

Although the ML9058 holds operation state by commands, excessive external noise might change the internal state.
On a chip-mounting and system level, it is necessary to take countermeasures against preventing noise from occurring. It is recommended to use the refresh sequence periodically to control sudden noise.

## MPU INTERFACE

The ML9058 series ICs can be connected directly to the 80 -series and 68 -series MPUs.
Further, by using the serial interface, it is possible to operate the LSI with a minimum number of signal lines. In addition, it is possible to expand the display area by using the ML9058 series LSIs in a multiple chip configuration. In this case, it is possible to select the individual LSI to be accessed using the chip select signals.

- 80-Series MPU

- 68-Series MPU

- Serial interface

## ML9059 ALIGNMENT MARK SPECIFICATION 1

## Alignment Mark Coordinates

| Alignment mark | $\mathrm{X}(\mu \mathrm{m})$ | $\mathrm{Y}(\mu \mathrm{m})$ |
| :---: | :---: | :---: |
| A | -4270.3 | 1364.5 |
| B | 4259.7 | 1364.5 |
| C | 4455 | -1180.9 |
| D | -4455 | -1180.9 |
| E | -4458.5 | 1368 |
| F | 4458.5 | -1368 |

## Alignment Mark Construction layer

> A,B,C,D: Metal Layer E,F:Bump Layer

## Alignment Mark Specification

| Symbol | Parameter | Mark | Size( $\mu \mathrm{m}$ ) |
| :---: | :---: | :---: | :---: |
| a | Alignment mark Width | A,B,C,D | 34 |
|  |  | E,F | 43 |
| b | Alignment mark Size | A,B,C,D | 100 |
|  |  | E,F | 98 |
| c | Alignment mark-to-adjacent pad metal Distance (MIN.) | A,B,C | 60 |
|  |  | D | 106.6 |
|  | Alignment mark-to-adjacent pad bump Distance (MIN.) | E | 109.4 |
|  |  | F | 77 |

## ML9058 GOLD BUMP SPECIFICATION

## Gold Bump Specification

| Symbo <br> I | Parameter | Min. | Typ. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| A | Bump Pitch (Min.Section: Segment Section) | 52 | - | - | $\mu \mathrm{m}$ |
| B | Bump Size (Segment Section: Pitch Direction) | 31 | 35 | 39 | $\mu \mathrm{~m}$ |
| C | Bump Size (Segment Section: Depth Direction) | 113 | 117 | 121 | $\mu \mathrm{~m}$ |
| D | Bumo-to-Bump Distance <br> (Segment Section: Pitch Direction) | 13 | 17 | 21 | $\mu \mathrm{~m}$ |
| E | Bump Pitch (Min.Section: Input Section) | 85 | - | - | $\mu \mathrm{m}$ |
| F | Bump Size (Input Section: Pitch Direction) | 64 | 68 | 72 | $\mu \mathrm{~m}$ |
| G | Bump Size (Input Section: Depth Direction) | 66 | 70 | 74 | $\mu \mathrm{~m}$ |
| H | Bumo-to-Bump Distance <br> (Input Section: Pitch Direction) | 13 | 17 | 21 | $\mu \mathrm{~m}$ |
| I | Bump Size (Figure "L" alignment mark: Length) | 94 | 98 | 102 | $\mu \mathrm{~m}$ |
| J | Bump Size (Figure "L" alignment mark: Width) | 39 | 43 | 47 | $\mu \mathrm{~m}$ |
| - | Pad center to Bump center allowable error | - | - | 2 | $\mu \mathrm{~m}$ |
| K | Bump Height | 10 | 15 | 20 | $\mu \mathrm{~m}$ |
| - | Bumph Height Dispersion Inside Chip (Range) | - | - | 3 | $\mu \mathrm{~m}$ |
| L | Bump Edge Height | - | - | 5 | $\mu \mathrm{~m}$ |
| - | Shear Strength (g) | 18 | - | - | g |
| - | Bump hardness: High (Hv: 25g load) | 50 | 90 | 130 | Hv |
| - | Bump hardness: Low (Hv: 25g load) | 30 | - | 80 | Hv |

- Chip Thickness: $625 \pm 15 \mu \mathrm{~m}$
- Chip Size: $9.164 \mathrm{~mm} \times 2.982 \mathrm{~mm}$

## EXAMPLE OF VOLTAGE MULTIPLIER CONNECTION

An example of the 3.5 -time voltage multiplier connection is shown below, as a variation of the 4 -time voltage multiplier.

Example of voltage multiplier connection

For the 3.5-time voltage multiplier, $\mathrm{V}_{\mathrm{IN}}$ should be in the voltage range shown below:
$4.8 \mathrm{~V} \leq \mathrm{V}_{\mathrm{IN}} \leq 5.2 \mathrm{~V}$
$\left(\mathrm{V}_{\text {OUT }}=3 \times\left(\mathrm{V}_{\text {IN }}\right)+(\mathrm{VC} 3+) \leq 18.33 \mathrm{~V}\right)$
VC3+ should be in the range of $\left(\mathrm{V}_{\mathbb{1}}\right) / 2 \pm 2 \%$.

## NOTICE

1. The information contained herein can change without notice owing to product and/or technical improvements. Before using the product, please make sure that the information being referred to is up-to-date.
2. The outline of action and examples for application circuits described herein have been chosen as an explanation for the standard action and performance of the product. When planning to use the product, please ensure that the external conditions are reflected in the actual circuit, assembly, and program designs.
3. When designing your product, please use our product below the specified maximum ratings and within the specified operating ranges including, but not limited to, operating voltage, power dissipation, and operating temperature.
4. Oki assumes no responsibility or liability whatsoever for any failure or unusual or unexpected operation resulting from misuse, neglect, improper installation, repair, alteration or accident, improper handling, or unusual physical or electrical stress including, but not limited to, exposure to parameters beyond the specified maximum ratings or operation outside the specified operating range.
5. Neither indemnity against nor license of a third party's industrial and intellectual property right, etc. is granted by us in connection with the use of the product and/or the information and drawings contained herein. No responsibility is assumed by us for any infringement of a third party's right which may result from the use thereof.
6. The products listed in this document are intended for use in general electronics equipment for commercial applications (e.g., office automation, communication equipment, measurement equipment, consumer electronics, etc.). These products are not authorized for use in any system or application that requires special or enhanced quality and reliability characteristics nor in any system or application where the failure of such system or application may result in the loss or damage of property, or death or injury to humans. Such applications include, but are not limited to, traffic and automotive equipment, safety devices, aerospace equipment, nuclear power control, medical equipment, and life-support systems.
7. Certain products in this document may need government approval before they can be exported to particular countries. The purchaser assumes the responsibility of determining the legality of export of these products and will take appropriate and necessary steps at their own expense for these.
8. No part of the contents contained herein may be reprinted or reproduced without our prior permission.
