

AC '97 SoundMAX® Codec

AD1981BL

AC '97 2.3 COMPATIBLE FEATURES

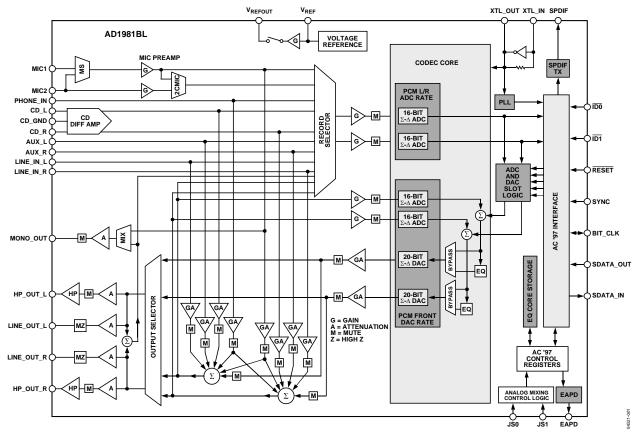

48-lead LQFP package, Pb-free available

S/PDIF output, 20-bit data format, supporting 48 kHz and 44.1 kHz sample rates Integrated stereo headphone amplifier Variable sample rate audio External audio power-down control >90 dB dynamic range Stereo full-duplex codec 20-bit PCM DAC 3 analog line-level stereo inputs for line-in, AUX, and CD Mono line-level phone input Dual MIC input with built-in programmable preamplifier High quality CD input with ground sense Mono output for speakerphone or internal speaker power management support

ENHANCED FEATURES Stereo MIC preamplifier support

Built-in digital equalizer function for optimized speaker sound Full-duplex variable sample rates from 7040 Hz to 48 kHz with 1 Hz resolution Jack sense pins for automatic output switching Software-programmed VREFOUT output for biasing

microphone and external power amplifier Low power 3.3 V operation for analog and digital supplies Multiple codec configuration options

ABSOLUTE MAXIMUM RATINGS

 $T_A = 25^{\circ}C$, unless otherwise noted.

Table 5.

| Parameter | Rating |
|--|------------------------------------|
| Power Supplies | |
| Digital (DV _{DD}) | –0.3 V to +3.6 V |
| Analog (AV _{DD}) | –0.3 V to +6.0 V |
| Input Current (Except Supply Pins) | ±10 mA |
| Signals Pins | |
| Digital Input Voltage | -0.3 V to DV _{DD} + 0.3 V |
| Analog Input Voltage | -0.3 V to AV _{DD} + 0.3 V |
| Ambient Temperature Range (Operating) | 0°C to 70°C |

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ENVIRONMENTAL CONDITIONS

 $\begin{array}{l} \mbox{Ambient Temperature Rating (LQFP Package)} \\ T_{CASE} = Case Temperature in ~^{C} \\ PD = Power Dissipation in W \\ \theta_{JA} Thermal Resistance (Junction to Ambient) \\ \theta_{JC} Thermal Resistance (Junction to Case) \end{array}$

Table 6. Thermal Resistance

| Package | θ _{JA} | θις |
|---------|-----------------|----------|
| LQFP | 50.1°C/W | 17.8°C/W |

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

All registers are not shown. Bits containing an X are assumed to be reserved.

Odd register addresses are aliased to the next lower even address. Reserved registers should not be written. Zeros should be written to reserved bits.

¹ For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 0x76. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, the RM bit has no effect.

X is a wild card, and has no effect on the value.

Writing any value to this register performs a register reset that causes all registers to revert to their default values (except 0x74, which forces the serial configuration). Reading this register returns the ID code of the part and a code for the type of 3D stereo enhancement.

ID[9:0] Identify Capability. The ID decodes the capabilities of AD1981BL based on the functions listed in Table 9.

MASTER VOLUME REGISTER

Index 0x02

This register controls the Line_Out volume controls for both stereo channels and the mute bit. Each volume subregister contains five bits, generating 32 volume levels with 31 steps of 1.5 dB each. Because AC '97 defines 6-bit volume registers, to maintain compatibility whenever the D5 or D13 bits are set to 1, their respective lower five volume bits are automatically set to 1 by the codec logic. On readback, all lower five bits read 1s whenever these bits are set to 1. Refer to Table 12 for examples.

All registers are not shown, and bits containing an X are assumed to be reserved.

Table 10.

| Bit | Mnemonic | Function |
|-----------|--------------------------------|--|
| RMV [4:0] | Right Master Volume Control | The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB. |
| RM | Right-Channel Mute | Once enabled by the MSPLT bit in Register 0x76, this bit mutes the right channel separately from the MM bit. Otherwise, this bit always reads 0 and has no effect when set to 1. |
| LMV [4:0] | Left Master Volume Control | The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB. |
| MM | Master Volume Mute | When this bit is set to 1, both the left and right channels are muted, unless the MSPLT bit in Register 0x76 is set to 1, in which case this mute bit affects only the left channel. |

HEADPHONE VOLUME REGISTER Index 0x04

This register controls the headphone volume controls for both stereo channels and the mute bit. Each volume subregister contains five bits, generating 32 volume levels with 31 steps of 1.5 dB each. Because AC '97 defines 6-bit volume registers, to maintain compatibility, whenever the D5 or D13 bits are set to 1, their respective lower five volume bits are automatically set to 1 by the codec logic. ¹ For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 0x76. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, the RM bit has no effect.

All registers are not shown, and bits containing an X are assumed to be reserved. Refer to Table 24 for examples.

| RM | Right-Channel Mute | Once enabled by the MSPLT bit in Register 0x76, this bit mutes the right channel separately from the IM bit. Otherwise, this bit always reads 0 and has no affect when set to 1. |
| LIM [3:0] | Left Input Mixer Gain Control | Each LSB represents 1.5 dB, $0000 = 0$ dB, and the gain range is 0 dB to 22.5 dB. |
| IM | Input Mute | When this bit is set to 1, both the left and right channels are muted, unless the MSPLT bit in Register 0x76 is set to 1, in which case this mute bit affects only the left channel. |

The ready bits are read-only; writing to REF, ANL, DAC, ADC has no effect. These bits indicate the status for the AD1981BL subsections. If the bit is a 1, that subsection is ready. Ready is defined as the subsection able to perform in its nominal state. All registers are not shown, and bits containing an X are assumed to be reserved.

Table 28.

|----------|----------------------------|---|
| ADC | | ADC Sections Ready to Transmit Data. |
| DAC | | DAC Sections Ready to Accept Data. |
| ANL | | Analog Amplifiers, Attenuators, and Mixers Ready. |
| REF | | Voltage References, VREF and VREFOUT, Up to Nominal Level. |
| PR [6:0] | Codec Power- Down Modes | The first three bits are to be used individually rather than in combination with each other. PR3 can be used in combination with PR2 or by itself. The mixer and reference cannot be powered down via PR3 unless the ADCs and DACs are also powered down. |
| | | Nothing else can be powered up until the reference is powered up. PR5 has no effect unless all ADCs, DACs, and the ac-link are powered down. The reference and the mixer can be either powered up or powered down, but all power-up sequences must be allowed to run to completion before PR5 and PR4 are both set. |
| | | In multiple codec systems, the master codec's PR5 and PR4 bits control the slave codec. PR5 is also effective in the slave codec, if the master's PR5 bit is clear, but the PR4 bit has no effect except to enable or disable PR5. |
| EAPD | External Audio | Controls the state of the EAPD pin. |
| | Power-Down | EAPD = 0 sets the EAPD pin low, enabling an external power amplifier (reset default). |
| | Control | EAPD = 1 sets the EAPD pin high, shutting the external power amplifier off. |

The extended audio ID register identifies which extended audio features are supported. A nonzero extended audio ID value indicates that one or more of the extended audio features are supported.

All registers are not shown, and bits containing an X are assumed to be reserved.

Table 30.

| Bit | Mnemonic | Function |
|------------|--|--|
| VRAS | Variable Rate PCM Audio Support (Read-Only) | This bit returns a 1 when Read To indicates that the variable rate PCM audio is supported. |
| SPDIF | SPDIF Support (Read-Only) | This bit returns a 1 when Read To indicates that the SPDIF transmitter is supported (IEC958). |
| | | This bit is also used to validate that the SPDIF transmitter output is enabled. The SPDIF bit can be set high only if the SPDIF pin (Pin 48) is pulled down at power-up, enabling the codec transmitter logic. If the SPDIF pin is floating or pulled high at power-up, the transmitter logic is disabled; therefore, this bit returns a low, indicating that the SPDIF transmitter is not available. This bit must always be read back to verify that the SPDIF transmitter is actually enabled. |
| DSA [1:0] | DAC Slot Assignments | Reset default = 00. |
| | (Read/Write) | 00 DACs 1, 2 = 3 and 4. |

| | | 10 DACs 1, 2 = 6 and 9. |
| | | 11 Reserved. |
| AMAP | Slot DAC Mappings Based on Codec ID (Read-Only) | This bit returns a 1 when read to indicate that slot/DAC mappings based on the codec ID are supported. |
| REVC [1:0] | AC '97 Revision Compliance | REVC [1:0] = 01 indicates that the codec is AC '97 revision 2.2-compliant (read-only). |

The extended audio status and control register is a read/write register that provides status and control of the extended audio features. All registers are not shown, and bits containing an X are assumed to be reserved.

| Table 31. | | |
|------------|---|---|
| Bit | Mnemonic | Function |
| VRA | Variable Rate Audio (Read/Write) | VRA = 0 sets the fixed sample rate audio to 48 kHz (reset default). VRA = 1 enables variable rate audio mode (enables sample rate registers and SLOTREQ signaling). |
| SPDIF | SPDIF Transmitter Subsystem Enable/Disable Bit (Read/Write) | SPDIF = 1 enables the SPDIF transmitter. SPDIF = 0 disables the SPDIF transmitter (default). This bit is also used to validate that the SPDIF transmitter output is enabled. The SPDIF bit can be set high only if the SPDIF pin (Pin 48) is pulled down at power-up, enabling the codec transmitter logic. If the SPDIF pin is floating or pulled high at power-up, the transmitter logic is disabled and this bit returns a low, indicating that the SPDIF transmitter is not available. This bit must always be read back to verify that the SPDIF transmitter is enabled. |
| SPSA [1:0] | SPDIF Slot Assignment Bits (Read/Write) | These bits control the SPDIF slot assignment and respective defaults, depending on the codec ID configuration. |

| Bit | Mnemonic | Function |
|--------|---|--|
| SPCV | SPDIF Configuration Valid (Read-Only) | This bit indicates the status of the SPDIF transmitter subsystem, enabling the driver to determine if the currently programmed SPDIF configuration is supported. SPCV is always valid, independent of the SPDIF enable bit status. |
| | | SPCV = 0 indicates that the current SPDIF configuration (SPSA, SPSR, DAC slot rate, DRS) is not valid (not supported). |
| | | SPCV = 1 indicates that the current SPDIF configuration (SPSA, SPSR, DAC slot rate, DRS) is valid (supported). |
| VFORCE | Validity Force Bit (Reset Default = 0) | When asserted, this bit forces the SPDIF stream validity flag (Bit 28 within each SPDIF L/R subframe) to be controlled by the V bit (D15) in Register 0x3A (SPDIF control register). |
| | | VFORCE = 0 and $V = 0$; the validity bit is managed by the codec error detection logic. |
| | | VFORCE = 0 and $V = 1$; the validity bit is forced high, indicating the subframe data is invalid. |
| | | VFORCE = 1 and $V = 0$; the validity bit is forced low, indicating the subframe data is valid. |
| | | VFORCE = 1 and $V = 1$; the validity bit is forced high, indicating the subframe data is invalid. |

Register 0x3A is a read/write register that controls SPDIF functionality and manages bit fields propagated as channel status (or subframe in the V case). With the exception of V, this register should be written to only when the SPDIF transmitter is disabled (SPDIF bit in Register 0x2A is 0). This ensures that control and status information start up correctly at the beginning of SPDIF transmission.

| | | SPSR [1:0] = 10: Transmit sample rate is 48 kHz (reset default). |
| | | SPSR [1:0] = 11: Not supported. |
| V | Validity | This bit affects the validity flag (Bit 28 transmitted in each SPDIF L/R subframe) and enables the SPDIF transmitter to maintain connection during error or mute conditions. |
| | | V = 1: Each SPDIF subframe (L + R) has Bit 28 set to 1. This tags both samples as invalid. |
| | | V = 0: Each SPDIF subframe (L + R) has Bit 28 set to 0 for valid data and 1 for invalid data (error condition). |
| | | When $V = 0$, asserting the VFORCE bit (D15) in Register 0x2A (Ext'd Audio Stat/Ctrl) forces the validity flag low, marking both samples as valid. |

Register 0x60 is a read/write register that controls the equalizer functionality and data setup. This register contains the biquad and coefficient address pointer, which is used in conjunction with the EQ data register (0x78) to set up the equalizer coefficients. The reset default disables the equalizer function until the coefficients can be properly set up by the software and sets the symmetry bit to allow equal coefficients for left and right channels. All registers are not shown, and bits containing an X are assumed to be reserved.

| CHS | Channel Select | CHS = 0 selects the left-channel coefficient's data block. CHS = 1 selects the right-channel coefficient's data block. |
| SYM | Symmetry | When set to 1, this bit indicates that the left- and right-channel coefficients are equal. This shortens the coefficients' setup sequence, because only the left-channel coefficients need to be addressed and set up. The right-channel coefficients are fetched from the left-channel memory. |
| MAD | Mixer ADC Loopback | Enables mixer ADC data to be summed into the PCM stream. |
| LBEN | Enable | 0 = No loopback allowed (default). 1 = Enable loopback. |
| EQM | Equalizer Mute | When set to 1, this bit disables the equalizer function (allows all data to pass through). The reset default sets this bit to 1, disabling the equalizer function until the biquad coefficients can be properly set. |

¹ For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 0x76. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, the RM bit has no effect.

All registers are not shown, and bits containing an X are assumed to be reserved. Refer to Table 39 for examples.

¹ For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 0x76. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, the RM bit has no effect.

X is a wild card, and has no effect on the value.

All register bits are read/write except for JSOST and JS1ST, which are read-only. All registers are not shown, and bits containing an X are assumed to be reserved.

| Bit | Mnemonic | Function |
|--------------|----------------------------|--|
| JSOINT | JS0 Interrupt | This bit indicates that Pin JSO has generated an interrupt. This bit remains set until the software services the JSO interrupt, that is, JSO ISR should clear this bit by writing a 0 to it. |
| | | The interrupt to the system is an OR combination of this bit and JS1INT. |
| | | The actual interrupt implementation is selected by the INTS bit (Register 0x76). It is also possible to generate a software system interrupt by writing a 1 to this bit. |
| JS1INT | JS1 Interrupt | This bit indicates that Pin JS1 has generated an interrupt. This bit remains set until the software services the JS1 interrupt, that is, JS1 ISR should clear this bit by writing a 0 to it. See the JS0INT description for details. |
| JSOST | JS0 State | This bit always reports the logic state of the JS0 pin. |
| JS1ST | JS1 State | This bit always reports the logic state of the JS1 pin. |
| JSOMD | JS0 Mode | This bit selects the operation mode for the JS0 pin. |
| | | 0 = Jack sense mode (default). |
| | | 1 = Interrupt mode. |
| JS1MD | JS1 Mode | This bit selects the operation mode for the JS1 pin. |
| | | 0 = Jack sense mode (default). |
| | | 1 = Interrupt mode. |
| JSOTMR | JS0 Timer Enable | If this bit is set to 1, JS0 must be high for >278 ms to be recognized. |
| JS1TMR | JS1 Timer Enable | If this bit is set to 1, JS1 must be high for >278 ms to be recognized. |
| JSOEQB | JS0 EQ Bypass Enable | This bit enables JS0 to control the EQ bypass. When this bit is set to 1, JS0 = 1 causes the EQ to be bypassed. |
| JS1EQB | JS1 EQ Bypass Enable | This bit enables JS1 to control the EQ bypass. When this bit is set to 1, JS1 = 1 causes the EQ to be bypassed. |
| JSMT [2:0] | JS Mute Enable Selector | These three bits select and enable the jack sense muting action (see Table 41). |

FMUTE = Output is forced to mute independent of the respective volume register setting. ACTIVE = Output is not muted, and its status is dependent on the respective volume register setting. OUT = Nothing plugged into the jack and, therefore, the JS status is low (via the load resistor pull-down). IN = Jack has plug inserted and, therefore, the JS status is high (via the codec JS internal pull-up).

This register is not reset when the reset register (Register 0x00) is written. All registers are not shown, and bits containing an X are assumed to be reserved.

Table 42.

| Bit | Mnemonic | Function |
|--------|--------------------------------|---|
| SPLNK | SPDIF Link | This bit enables the SPDIF to link with the DAC for data requests. |
| | | 0 = SPDIF and DAC are not linked. |
| | | 1 = SPDIF and DAC are linked and receive the same data requests (reset default). |
| SPDZ | SPDIF DACZ | 0 = Repeat last sample out of the SPDIF stream if FIFO underruns (reset default). |
| | | 1 = Forces midscale sample out the SPDIF stream if FIFO underruns. |
| SPAL | SPDIF ADC Loop- | 0 = SPDIF transmitter is connected to the ac-link stream (reset default). |
| | Around | 1 = SPDIF transmitter is connected to the digital ADC stream, not the ac-link. |
| INTS | Interrupt Mode Select | This bit selects the JS interrupt implementation path. |
| | | 0 = Bit 0 Slot 12 (modem interrupt). |
| | | 1 = Slot 6 valid bit (MIC ADC interrupt). |
| CHEN | Chain Enable | This bit enables chaining of a slave codec SDATA_IN stream into the $\overline{ID0}$ pin (Pin 45). |
| | | 0 = Disable chaining (reset default). |
| | | $1 =$ Enable chaining into $\overline{ID0}$ pin. |
| REGM0 | Master Codec Register Mask | |
| REGM1 | Slave 1 Codec Register Mask | |
| REGM2 | Slave 2 Codec Register Mask | |
| SLOT16 | Enable 16-Bit Slot Mode | Slot 16 makes all ac-link slots 16 bits in length, formatted into 16 slots. This is a preferred mode for DSP serial port interfacing. |

| Table 43. | |
|-----------|--|
|-----------|--|

| Bit | Mnemonic | Function |
|-----------|-----------------------|---|
| MBG [1:0] | MIC Boost Gain Change | These two bits allow changing the MIC preamp gain from the nominal 20 dB gain. |
| | Register | This gain setting takes effect only while Bit D6 (M20) on the MIC volume register (0x0E) is set to 1 otherwise, the MIC boost block has a gain of 0 dB. |
| | | 00 = 20 dB gain (reset default). |
| | | 01 = 10 dB gain. |
| | | 10 = 30 dB gain. |
| | | 11 = Reserved. |

| Bit | Mnemonic | Function |
|-------|----------------------|---|
| VREFD | VREFOUT Disable | This bit disables VREFOUT, placing it into high Z out mode. This bit overrides the VREFH bit selection |
| | | $0 = V_{REFOUT}$ pin is driven by the internal reference (reset default). |
| | | $1 = V_{REFOUT}$ pin is placed into high Z out mode. |
| VREFH | VREFOUT High | $0 = V_{REFOUT}$ pin is set to 2.25 V output (reset default). |
| | | $1 = V_{REFOUT}$ pin is set to 2.25 V output (is set to 3.7 V only if AVDD = 5 V). |
| MADST | Mixer ADC Status Bit | This bit indicates status of the mixer digitizing ADC (left and right channels). |
| | | 0 = Mixer ADC not ready. |
| | | 1 = Mixer ADC ready. |
| 2CMIC | 2-Channel MIC Select | This bit enables simultaneous recording from MIC1 and MIC2 inputs for applications that use a stereo microphone array. This register works in conjunction with the MS bit in Register 0x20. |
| | | 0 = MIC1 or MIC2 (determined by the MS bit) is routed to the record selector's left and right MIC channels, as well as to the mixer (reset default). |
| | | 1 = MIC1 is routed to the record selector's left MIC channel and MIC2 is routed to the record selector's right MIC channel. In this mode, the MS bit should be set low, and MIC1 can still be enabled into the mixer. |
| MADPD | Mixer ADC Power-Down | This bit controls power-down for mixer digitizing ADC. |
| | | 0 = Mixer ADC is powered on (default). |
| | | 1 = Mixer ADC is powered down. |
| FMXE | Front DAC into Mixer | This bit controls the front (main) DAC to mixer mute switches. |
| | Enable | 0 = Front DAC outputs are allowed to sum into the mixer (reset default). |
| | | 1 = Front DAC outputs are muted into the mixer (blocked). |
| DAM | Digital Audio Mode | PCM DAC outputs bypass the analog mixer and are sent directly to the codec output. |
| LODIS | LINE_OUT Disable | This bit disables the LINE_OUT pins (L/R), placing them into high Z mode so that the assigned output audio jack can be shared for the input function (or other function). |
| | | 0 = LINE_OUT pins have normal audio drive capability (reset default). |
| | | 1 = LINE_OUT pins are placed into high Z mode. |
| MSPLT | Mute Split | This bit allows separate mute control bits for the master, headphone, LINE_IN, CD, AUX, and PCM volume control registers as well as for the record gain register. |
| | | 0 = Both left- and right-channel mutes are controlled by Bit 15 in the respective registers (reset default). |
| | | 1 = Bit 15 affects only the left-channel mute, and Bit 7 affects only the right-channel mute. |
| DACZ | DAC Zero-Fill | This bit determines DAC data fill under starved conditions. |
| | | 0 = DAC data is repeated when DACs are starved for data (reset default). |
| | | 1 = DAC is zero-filled when DACs are starved for data. |

¹Z = Pb-free part. The AD1981BLJSTZ is a lead-free environmentally friendly product. It is manufactured using the most up-to-date materials and processes. The coating on the leads of each device is 100% pure tin electroplate. The device is suitable for lead-free applications and can withstand surface-mount soldering at up to 255°C (±5°C). In addition, it is backward compatible with conventional tin-lead soldering processes. This means that the electroplated tin coating can be soldered with tinlead solder pastes at reflow temperatures of 220°C to 235°C.
