## Features

■ True dual-ported memory cells that allow simultaneous access of the same memory location

- Synchronous pipelined operation

■ Family of 2-Mbit, 4-Mbit, and 9-Mbit devices
$■$ Pipelined output mode allows fast operation

- 0.18 micron CMOS for optimum speed and power

■ High speed clock to data access
■ 3.3 V low power
a Active as low as 225 mA (typ)
a Standby as low as 55 mA (typ)

- Mailbox function for message passing
- Global master reset

■ Separate byte enables on both ports
■ Commercial and Industrial temperature ranges
■ IEEE 1149.1 compatible JTAG boundary scan
■ 144-ball FBGA ( $13 \mathrm{~mm} \times 13 \mathrm{~mm}$ ) ( 1.0 mm pitch)
■ 120-pin TQFP $(14 \mathrm{~mm} \times 14 \mathrm{~mm} \times 1.4 \mathrm{~mm})$
■ Pb-free packages available

- Counter wrap around control
a Internal mask register controls counter wrap around
$\square$ Counter-interrupt flags to indicate wrap around
$\square$ Memory block retransmit operation
■ Counter readback on address lines
■ Mask register readback on address lines
■ Dual chip enables on both ports for easy depth expansion

## Functional Description

The FLEx18 ${ }^{\text {TM }}$ family includes 2-Mbit, 4-Mbit, and $9-\mathrm{Mbit}$ pipelined, synchronous, true dual port static RAMs that are high speed, low power 3.3 V CMOS. Two ports are provided, permitting independent, simultaneous access to any location in memory. The result of writing to the same location by more than one port at the same time is undefined. Registers on control, address, and data lines allow for minimal setup and hold time.
During a Read operation, data is registered for decreased cycle time. Each port contains a burst counter on the input address register. After externally loading the counter with the initial address, the counter increments the address internally (more details to follow). The internal Write pulse width is independent of the duration of the R/W input signal. The internal Write pulse is self-timed to allow the shortest possible cycle times.
A HIGH on $\overline{\mathrm{CE}}_{0}$ or LOW on $\mathrm{CE}_{1}$ for one clock cycle powers down the internal circuitry to reduce the static power consumption. One cycle with chip enables asserted is required to reactivate the outputs.
Additional features include: readback of burst-counter internal address value on address lines, counter-mask registers to control the counter wrap around, counter interrupt (CNTINT) flags, readback of mask register value on address lines, retransmit functionality, interrupt flags for message passing, JTAG for boundary scan, and asynchronous Master Reset (MRST).
The CY7C0833V device in this family has limited features. See Address Counter and Mask Register Operations on page 7 for details.

## Product Selection Guide

## Pin Definitions

| Left Port | Right Port | Description |
| :---: | :---: | :---: |
| $\mathrm{A}_{0 \mathrm{~L}}-\mathrm{A}_{18 \mathrm{~L}}{ }^{[7]}$ | $\mathrm{A}_{0 \mathrm{R}}-\mathrm{A}_{18 \mathrm{R}}{ }^{[7]}$ | Address Inputs. |
| $\mathrm{ADS}_{\mathrm{L}}{ }^{\text {[8] }}$ | $\mathrm{ADS}_{\mathrm{R}}{ }^{[8]}$ | Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW for the part using the externally supplied address on the address pins and for loading this address into the burst address counter. |
| $\overline{\mathrm{CE}}_{0 \mathrm{~L}}{ }^{[8]}$ | $\overline{\mathrm{CE}}_{0 \mathrm{R}}{ }^{[8]}$ | Active LOW Chip Enable Input. |
| $\mathrm{CE}_{1 \mathrm{~L}}{ }^{[9]}$ | $\mathrm{CE}_{1 \mathrm{R}}{ }^{[9]}$ | Active HIGH Chip Enable Input. |
| $\mathrm{CLK}_{\mathrm{L}}$ | $\mathrm{CLK}_{\mathrm{R}}$ | Clock Signal. Maximum clock input rate is $\mathrm{f}_{\text {MAX }}$. |
| CNTEN ${ }^{\text {[8] }}$ | CNTEN $\mathrm{R}^{[8]}$ | Counter Enable Input. Asserting this signal LOW increments the burst address counter of its respective port on each rising edge of CLK. The increment is disabled if $\overline{\text { ADS }}$ or $\overline{\text { CNTRST }}$ are asserted LOW. |
| $\mathrm{CNTRST}_{\mathrm{L}}{ }^{\text {[9] }}$ | CNTRST $_{\text {R }}{ }^{[9]}$ | Counter Reset Input. Asserting this signal LOW resets to zero the unmasked portion of the burst address counter of its respective port. CNTRST is not disabled by asserting ADS or CNTEN. |
| CNT/ $\overline{\mathrm{MSK}}^{\text {[9] }}$ | $\mathrm{CNT} / \overline{\mathrm{MSK}}_{\mathrm{R}}{ }^{[9]}$ | Address Counter Mask Register Enable Input. Asserting this signal LOW enables access to the mask register. When tied HIGH, the mask register is not accessible and the address counter operations are enabled based on the status of the counter control signals. |
| $\mathrm{DQ}_{0 \mathrm{~L}}-\mathrm{DQ}_{17 \mathrm{~L}}$ | $\mathrm{DQ}_{0 \mathrm{O}}-\mathrm{DQ}_{17 \mathrm{R}}$ | Data Bus Input/Output. |
| $\overline{\mathrm{OE}}_{\mathrm{L}}$ | $\overline{\mathrm{OE}}_{\mathrm{R}}$ | Output Enable Input. This asynchronous signal must be asserted LOW to enable the DQ data pins during Read operations. |
| $\overline{\mathrm{INT}}_{\mathrm{L}}$ | $\overline{\mathrm{INT}}_{\mathrm{R}}$ | Mailbox Interrupt Flag Output. The mailbox permits communications between ports. The upper two memory locations are used for message passing. $\mathrm{INT}_{\mathrm{L}}$ is asserted LOW when the right port writes to the mailbox location of the left port, and vice versa. An interrupt to a port is deasserted HIGH when it reads the contents of its mailbox. |
| $\mathrm{CNTINT}_{\mathrm{L}}{ }^{[10]}$ | $\overline{\text { CNTINT }}_{\text {R }}{ }^{[10]}$ | Counter Interrupt Output. This pin is asserted LOW when the unmasked portion of the counter is incremented to all '1s.' |
| $\mathrm{R} / \bar{W}_{\mathrm{L}}$ | $\mathrm{R} / \overline{\mathrm{W}}_{\mathrm{R}}$ | Read/Write Enable Input. Assert this pin LOW to write to, or HIGH to Read from the dual port memory array. |
| $\overline{\mathrm{B}}_{0 \mathrm{~L}} \overline{\mathrm{~B}}_{1 \mathrm{~L}}$ | $\overline{\mathrm{B}}_{0 \mathrm{R}}-\overline{\mathrm{B}}_{1 \mathrm{R}}$ | Byte Select Inputs. Asserting these signals enables Read and Write operations to the corresponding bytes of the memory array. |
| $\overline{\text { MRST }}$ |  | Master Reset Input. $\overline{\text { MRST }}$ is an asynchronous input signal and affects both ports. Asserting MRST LOW performs all of the reset functions as described in the text. A MRST operation is required at power up. |
| TMS |  | JTAG Test Mode Select Input. It controls the advance of JTAG TAP state machine. State machine transitions occur on the rising edge of TCK. |
| TDI |  | JTAG Test Data Input. Data on the TDI input is shifted serially into selected registers. |
| TCK |  | JTAG Test Clock Input. |
| TDO |  | JTAG Test Data Output. TDO transitions occur on the falling edge of TCK. TDO is normally three-stated except when captured data is shifted out of the JTAG TAP. |
| $\mathrm{V}_{\mathrm{SS}}$ |  | Ground Inputs. |
| $\mathrm{V}_{\mathrm{DD}}$ |  | Power Inputs. |

[^0]
## Byte Select Operation

| Control Pin | Effect |
| :---: | :---: |
| $\overline{\mathrm{B}}_{0}$ | $\mathrm{DQ}_{0-8}$ Byte Control |
| $\overline{\mathrm{B}}_{1}$ | $\mathrm{DQ}_{9-17}$ Byte Control |

## Master Reset

The FLEx18 family devices undergo a complete reset by taking its MRST input LOW. The MRST input can switch asynchronously to the clocks. An MRST initializes the internal burst counters to zero, and the counter mask registers to all ones (completely unmasked). MRST also forces the Mailbox Interrupt (INT) flags and the Counter Interrupt (CNTINT) flags HIGH. MRST must be performed on the FLEx18 family devices after power up.

## Mailbox Interrupts

The upper two memory locations may be used for message passing and permit communications between ports. Table 1 on page 8 shows the interrupt operation for both ports of CY7C0833V. The highest memory location, 7FFFF is the mailbox for the right port and 7FFFE is the mailbox for the left port. Table 1 on page 8 shows that to set the $\mathrm{INT}_{\mathrm{R}}$ flag, a Write operation by the left port to address 7FFFF asserts $\overline{I N T}_{R}$ LOW. At least one byte has to be active for a Write to generate an interrupt. A valid Read of the 7FFFF location by the right port resets $\mathrm{INT}_{\mathrm{R}}$ HIGH. At least one byte must be active for a Read to reset the interrupt. When one port Writes to the other port's mailbox, the $\overline{\mathrm{NT}}$ of the port that the mailbox belongs to is asserted LOW. The INT is reset when the owner (port) of the mailbox Reads the contents of the mailbox. The interrupt flag is set in a flow-through mode (that is, it follows the clock edge of the writing port). Also, the flag is reset in a flow-through mode (that is, it follows the clock edge of the reading port).
Each port can read the other port's mailbox without resetting the interrupt. And each port can write to its own mailbox without setting the interrupt. If an application does not require message passing, INT pins should be left open.

## Address Counter and Mask Register Operations

This section ${ }^{[11]}$ describes the features only apply to 2-Mbit and 4 -Mbit devices. It does not apply to 9 Mbit device. Each port of these devices has a programmable burst address counter. The burst counter contains three registers: a counter register, a mask register, and a mirror register.

The counter register contains the address used to access the RAM array. It is changed only by the Counter Load, Increment, Counter Reset, and by master reset (MRST) operations.
The mask register value affects the Increment and Counter Reset operations by preventing the corresponding bits of the counter register from changing. It also affects the counter interrupt output (CNTINT). The mask register is changed only by the Mask Load and Mask Reset operations and by the MRST. The mask register defines the counting range of the counter register. It divides the counter register into two regions: zero or more '0s' in the most significant bits define the masked region, one or more ' 1 s ' in the least significant bits define the unmasked region. Bit 0 may also be ' 0 ,' masking the least significant counter bit and causing the counter to increment by two instead of one.
The mirror register is used to reload the counter register on increment operations (see Retransmit on page 9). It always contains the value last loaded into the counter register, and is changed only by the Counter Load, and by the MRST instructions. Table 2 on page 9 summarizes the operation of these registers and the required input control signals. The MRST control signal is asynchronous. All the other control signals in Table 2 on page 9 (CNT/MSK, CNTRST, ADS, CNTEN) are synchronized to the port's CLK. All these counter and mask operations are independent of the port's chip enable inputs (CEO and CE1).
Counter enable ( $\overline{\text { CNTEN }}$ ) inputs are provided to stall the operation of the address input and use the internal address generated by the internal counter for fast, interleaved memory applications. A port's burst counter is loaded when the port's address strobe (ADS) and CNTEN signals are LOW. When the port's CNTEN is asserted and the ADS is deasserted, the address counter increments on each LOW to HIGH transition of that port's clock signal. This reads and writes one word from and to each successive address location until CNTEN s deasserted. The counter can address the entire memory array, and loops back to the start. Counter reset (CNTRST) is used to reset the unmasked portion of the burst counter to $1 / 0 \mathrm{~s}$. A counter-mask register is used to control the counter wrap.

## Note

11. This section describes the CY7C0832AV/CY7C0832BV and CY7C0831AV having 18 and17 address bits.

Table 1. Interrupt Operation Example ${ }^{[12, ~ 13, ~ 14, ~ 15, ~ 16, ~ 17] ~}$

| Function | Left Port |  |  |  | Right Port |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | R/ $\bar{W}_{\text {L }}$ | $\overline{C E}_{L}$ | $\mathrm{A}_{0 L}-\mathrm{A}_{18 \mathrm{~L}}$ | $\mathrm{INT}_{\mathrm{L}}$ | $\mathrm{R} / \bar{W}_{\mathrm{R}}$ | $\overline{C E}_{R}$ | $\mathrm{A}_{0 \mathrm{R}}-\mathrm{A}_{18 \mathrm{R}}$ | $\mathrm{INT}_{\mathrm{R}}$ |
| Set Right $\overline{\mathrm{INT}}_{\mathrm{R}}$ Flag | L | L | 3FFFF | X | X | X | X | L |
| Reset Right $\overline{\mathrm{INT}}_{\mathrm{R}}$ Flag | X | X | X | X | H | L | 3FFFF | H |
| Set Left $\overline{\mathrm{INT}}_{\mathrm{L}}$ Flag | X | X | X | L | L | L | 3FFFE | X |
| Reset Left $\overline{\mathrm{INT}}_{\mathrm{L}}$ Flag | H | L | 3FFFE | H | X | X | X | X |
| Set Right $\overline{\mathrm{NTT}}_{\mathrm{R}}$ Flag | L | L | 3FFFF | X | X | X | X | L |

## Counter Reset Operation

All unmasked bits of the counter are reset to ' 0 .' All masked bits remain unchanged. The mirror register is loaded with the value of the burst counter. A Mask Reset followed by a Counter Reset resets the counter and mirror registers to 00000, as does master reset (MRST).

## Counter Load Operation

The address counter and mirror registers are both loaded with the address value presented at the address lines.

## Counter Increment Operation

When the address counter register is initially loaded with an external address, the counter can internally increment the address value, potentially addressing the entire memory array. Only the unmasked bits of the counter register are incremented. The corresponding bit in the mask register must be a ' 1 ' for a counter bit to change. The counter register is incremented by 1 if the least significant bit is unmasked, and by 2 if it is masked. If all unmasked bits are ' 1 ,' the next increment wraps the counter back to the initially loaded value. If an Increment results in all the unmasked bits of the counter being ' 1 s ,' a counter interrupt flag (CNTINT) is asserted. The next Increment returns the counter register to its initial value, which was stored in the mirror register. The counter address can instead be forced to loop to 00000 by externally connecting CNTINT to CNTRST. ${ }^{[18]}$ An increment that results in one or more of the unmasked bits of the counter being ' 0 ' deasserts the counter interrupt flag. The example in Figure 4 on page 11 shows the counter mask register loaded with a mask value of 0003Fh unmasking the first 6 bits with bit ' 0 ' as the LSB and bit ' 16 ' as the MSB. The maximum value the mask register can be loaded with is 3FFFFFh. Setting the mask register to this value allows the counter to access the entire memory space. The
address counter is then loaded with an initial value of 8 h . The base address bits (in this case, the 6th address through the 16th address) are loaded with an address value but do not increment after the counter is configured for increment operation. The counter address starts at address 8 h . The counter increments its internal address value until it reaches the mask register value of 3Fh. The counter wraps around the memory block to location 8h at the next count. CNTINT is issued when the counter reaches its maximum value

## Counter Hold Operation

The value of all three registers can be constantly maintained unchanged for an unlimited number of clock cycles. Such operation is useful in applications where wait states are needed, or when address is available a few cycles ahead of data in a shared bus interface.

## Counter Interrupt

The counter interrupt ( $\overline{\mathrm{CNTINT}})$ is asserted LOW when an increment operation results in the unmasked portion of the counter register being all '1s.' It is deasserted HIGH when an Increment operation results in any other value. It is also de-asserted by Counter Reset, Counter Load, Mask Reset and Mask Load operations, and by MRST.

## Counter Readback Operation

The internal value of the counter register can be read out on the address lines. Readback is pipelined; the address is valid $\mathrm{t}_{\mathrm{CA}}$ after the next rising edge of the port's clock. If address readback occurs while the port is enabled (CE0 LOW and CE1 HIGH), the data lines (DQs) are three-stated. Figure 3 on page 10 shows a block diagram of the operation.

[^1]Table 2. Address Counter and Counter-Mask Register Control Operation (Any Port) ${ }^{[19,20]}$

| CLK | MRST | CNT/MSK | CNTRST | ADS | CNTEN | Operation | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | L | X | X | X | X | Master Reset | Reset address counter to all 0s and mask register to all 1s. |
| $\ldots$ | H | H | L | X | X | Counter Reset | Reset counter unmasked portion to all Os. |
| $\square$ | H | H | H | L | L | Counter Load | Load counter with external address value presented on address lines. |
| $\square$ | H | H | H | L | H | Counter Readback | Read out counter internal value on address lines. |
| $\square$ | H | H | H | H | L | Counter Increment | Internally increment address counter value. |
| $\square$ | H | H | H | H | H | Counter Hold | Constantly hold the address value for multiple clock cycles. |
| $\square$ | H | L | L | X | X | Mask Reset | Reset mask register to all 1s. |
| $\checkmark$ | H | L | H | L | L | Mask Load | Load mask register with value presented on the address lines. |
| $\checkmark$ | H | L | H | L | H | Mask Readback | Read out mask register value on address lines. |
| - | H | L | H | H | X | Reserved | Operation undefined |

## Retransmit

Retransmit is a feature that allows the Read of a block of memory more than once without the need to reload the initial address. This eliminates the need for external logic to store and route data. It also reduces the complexity of the system design and saves board space. An internal mirror register is used to store the initially loaded address counter value. When the counter unmasked portion reaches its maximum value set by the mask register, it wraps back to the initial value stored in this mirror register. If the counter is continuously configured in increment mode, it increments again to its maximum value and wraps back to the value initially stored into the mirror register. Thus, the repeated access of the same data is allowed without the need for any external logic.

## Mask Reset Operation

The mask register is reset to all ' 1 s ,' which unmasks every bit of the counter. Master reset (MRST) also resets the mask register to all ' 1 s '.

## Mask Load Operation

The mask register is loaded with the address value presented at the address lines. Not all values permit correct increment operations. Permitted values are of the form $2^{n}-1$ or $2^{n}-2$. From the most significant bit to the least significant bit, permitted values have zero or more '0s,' one or more ' 1 s ,' or one ' 0. .' Thus 3FFFF, 003FE, and 00001 are permitted values, but 3F0FF, $003 F C$, and 00000 are not.

## Mask Readback Operation

The internal value of the mask register can be read out on the address lines. Readback is pipelined; the address is valid $\mathrm{t}_{\mathrm{CM} 2}$ after the next rising edge of the port's clock. If mask readback occurs while the port is enabled (CEO LOW and CE1 HIGH), the data lines (DQs) is three-stated. Figure 3 on page 10 shows a block diagram of the operation.

## Counting by Two

When the least significant bit of the mask register is ' 0 ,' the counter increments by two. This may be used to connect the $\times 18$ devices as a 36-bit single port SRAM in which the counter of one port counts even addresses and the counter of the other port counts odd addresses. This even-odd address scheme stores one half of the 36 -bit data in even memory locations, and the other half in odd memory locations.

[^2]Figure 3. Counter, Mask, and Mirror Logic Block Diagram ${ }^{[21]}$

Note
21. CY7C0831AV has 17 address bits, CY7C0832AV/CY7C0832BV has 18 address bits and CY7C0833V has 19 address bits.

Figure 4. Programmable Counter-Mask Register Operation ${ }^{[22,23]}$

## IEEE 1149.1 Serial Boundary Scan (JTAG) ${ }^{[24]}$

The FLEx18 family devices incorporate an IEEE 1149.1 serial boundary scan test access port (TAP). The TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 compliant TAPs. The TAP operates using JEDEC-standard 3.3 V I/O logic levels. It is composed of three input connections and one output connection required by the test logic defined by the standard.

## Performing a TAP Reset

A reset is performed by forcing TMS HIGH ( $\mathrm{V}_{\mathrm{DD}}$ ) for five rising edges of TCK. This reset does not affect the operation of the devices, and may be performed while the device is operating. An MRST must be performed on the devices after power up.

## Performing a Pause/Restart

When a SHIFT-DR PAUSE-DR SHIFT-DR is performed the scan chain outputs the next bit in the chain twice. For example, if the value expected from the chain is 1010101, the device outputs a 11010101. This extra bit causes some testers to report an erroneous failure for the devices in a scan test. Therefore the tester should be configured to never enter the PAUSE-DR state.

## Boundary Scan Hierarchy for 9-Mbit Device

Internally, the CY7C0833V have two DIEs. Each DIE contain all the circuitry required to support boundary scan testing. The circuitry includes the TAP, TAP controller, instruction register, and data registers. The circuity and operation of the DIE boundary scan are described in detail below. The scan chain of each DIE are connected serially to form the scan chain of the CY7C0833V as shown in Figure 5 on page 12. TMS and TCK are connected in parallel to each DIE to drive all TAP controllers in unison. In many cases, each DIE is supplied with the same instruction. In other cases, it might be useful to supply different instructions to each DIE. One example would be testing the device ID of one DIE while bypassing the others.

Each pin of FLEx18 family is typically connected to multiple DIEs. For connectivity testing with the EXTEST instruction, it is desirable to check the internal connections between DIEs and the external connections to the package. This is accomplished by merging the netlist of the devices with the netlist of the user's circuit board. To facilitate boundary scan testing of the devices, Cypress provides the BSDL file for each DIE, the internal netlist of the device, and a description of the device scan chain. The user can use these materials to easily integrate the devices into the board's boundary scan environment.

[^3]Figure 5. Scan Chain for 9 Mb Device

## Identification Register Definitions

| Instruction Field | Value | Description |
| :--- | :--- | :--- |
| Revision Number (31:28) | Oh | Reserved for version number. |
| Cypress Device ID (27:12) | C090h | Defines Cypress part number for CY7C0832AV/CY7C0832BV |
|  | C091h | Defines Cypress part number for CY7C0831AV |
| Cypress JEDEC ID (11:1) | 034 h | Allows unique identification of the DP family device vendor. |
| ID Register Presence (0) | 1 | Indicates the presence of an ID register. |

## Scan Registers Sizes

| Register Name | Bit Size |
| :---: | :---: |
| Instruction | 4 |
| Bypass | 1 |
| Identification | 32 |
| Boundary Scan | $\mathrm{n}^{[25]}$ |

## Instruction Identification Codes

| Instruction | Code |  |
| :--- | :--- | :--- |
| EXTEST | 0000 | Captures the Input/Output ring contents. Places the BSR between the TDI and TDO. |
| BYPASS | 1111 | Places the BYR between TDI and TDO. |
| IDCODE | 1011 | Loads the IDR with the vendor ID code and places the register between TDI and TDO. |
| HIGHZ | 0111 | Places BYR between TDI and TDO. Forces all device output drivers to a High Z state. |
| CLAMP | 0100 | Controls boundary to 1/0. Places BYR between TDI and TDO. |
| SAMPLE/PRELOAD | 1000 | Captures the input/output ring contents. Places BSR between TDI and TDO. |
| NBSRST | 1100 | Resets the non-boundary scan logic. Places BYR between TDI and TDO. |
| RESERVED | All other codes | Other combinations are reserved. Do not use other than the above. |

Note
25. See details in the device BSDL file

## Maximum Ratings

Exceeding maximum ratings ${ }^{[26]}$ may impair the useful life of the device. These user guidelines are not tested.
Storage Temperature $\qquad$ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient Temperature with Power Applied $\qquad$ $-55^{\circ} \mathrm{C}$ to $+125{ }^{\circ} \mathrm{C}$
Supply Voltage to Ground Potential $\qquad$ -0.5 V to +4.6 V
DC Voltage Applied to
Outputs in High Z State $\qquad$ -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$
DC Input Voltage $\qquad$ -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}^{[27]}$

Output Current into Outputs (LOW)
20 mA
Static Discharge Voltage
(JEDEC JESD22-A114-2000B) ............................... > 2000V
Latch Up Current
> 200 mA
Operating Range

| Range | Ambient <br> Temperature | $\mathbf{V}_{\mathrm{DD}}$ |
| :--- | :---: | :---: |
| Commercial | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | $3.3 \mathrm{~V} \pm 165 \mathrm{mV}$ |
| Industrial | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $3.3 \mathrm{~V} \pm 165 \mathrm{mV}$ |

Figure 7. JTAG Switching Waveform

Figure 8. Master Reset

Figure 9. Read Cycle ${ }^{[33,34,35,36,37]}$

Notes
33. $\overline{C E}$ is internal signal. $\overline{C E}=L O W$ if $\overline{C E}_{0}=$ LOW and $C E_{1}=$ HIGH. For a single Read operation, CE only needs to be asserted once at the rising edge of the CLK and can be deasserted after that. Data is out after the following CLK edge and is three-stated after the next CLK edge.
34. $\overline{\mathrm{OE}}$ is asynchronously controlled; all other inputs (excluding MRST and JTAG) are synchronous to the rising clock edge.
35. $\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\mathrm{LOW}$, and $\overline{\mathrm{MRST}}=\overline{\mathrm{CNTRST}}=\mathrm{CNT} / \mathrm{MSK}=\mathrm{HIGH}$.
36. The output is disabled (high-impedance state) by $\overline{\mathrm{CE}}=\mathrm{V}_{\mathrm{IH}}$ following the next rising edge of the clock.
37. Addresses need not be accessed sequentially because $\overline{A D S}=\overline{C N T E N}=V_{I L}$ with $C N T / M S K=V_{I H}$ constantly loads the address on the rising edge of the $C L K$. Numbers are for reference only.

Figure 10. Bank Select Read ${ }^{[38,39]}$

Figure 11. Read-to-Write-to-Read $(\overline{\mathrm{OE}}=\mathrm{LOW})^{[40,41,42,43,44]}$

Notes
38. In this depth-expansion example, B1 represents Bank \#1 and B2 is Bank \#2; each bank consists of one Cypress FLEx18 device from this data sheet. ADDRESS $_{(B 1)}=$ ADDRESS $_{(B 2)}$.
39. $\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\overline{\mathrm{BEO}}-\overline{\mathrm{BE1}}=\overline{\mathrm{OE}}=\mathrm{LOW} ; \overline{\mathrm{MRST}}=\overline{\mathrm{CNTRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$.
40. Addresses need not be accessed sequentially because $\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\mathrm{V}_{\mathrm{IL}}$ with $\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{V}_{\mathrm{IH}}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.
41. Output state (HIGH, LOW, or high-impedance) is determined by the previous cycle control signals.
42. During "No Operation," data in memory at the selected address may be corrupted and should be rewritten to ensure data integrity.
43. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\overline{\mathrm{BE}}_{0}-\overline{\mathrm{BE}}_{1}=\mathrm{LOW} ; \mathrm{CE}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{HIGH}$.
44. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{BE}}_{0}-\overline{\mathrm{BE}}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$. When R/ $\overline{\mathrm{W}}$ first switches low, because OE $=\mathrm{LOW}$, the Write operation cannot be completed (labelfed as no operation). One clock cycle is required to three-state the I/O for the Write operation on the next rising edge of CLK.

Switching Waveforms (continued)
Figure 12. Read-to-Write-to-Read ( $\overline{\mathrm{OE}}$ Controlled) ${ }^{[45, ~ 46, ~ 47, ~ 48] ~}$

Figure 13. Read with Address Counter Advance ${ }^{[47]}$

Notes
45. Addresses need not be accessed sequentially because $\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\mathrm{V}_{\mathrm{IL}}$ with $\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{V}_{\mathrm{IH}}$ constantly loads the address on the rising edge of the CLK . Numbers are for reference only.
46. Output state (HIGH, LOW, or high-impedance) is determined by the previous cycle control signals.
47. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\underline{\mathrm{BE}_{0}}-\overline{B E}_{1}=\mathrm{LOW} ; \mathrm{CE}_{1}=\mathrm{R} / \mathrm{W}=\mathrm{CNTRST}=\mathrm{MRST}=\mathrm{HIGH}$.
48. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{BE}}_{0}-\overline{\mathrm{BE}}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$. When $\mathrm{R} / \overline{\mathrm{W}}$ first switches low, because OE $=\mathrm{LOW}$, the Write operation cannot be completed (labelled as no operation). One clock cycle is required to three-state the I/O for the Write operation on the next rising edge of CLK.

## Acronyms

| Acronym | Description |
| :--- | :--- |
| BGA | ball grid array |
| $\overline{\text { CE }}$ | chip enable |
| CMOS | complementary metal oxide semiconductor |
| FBGA | fine-pitch ball grid array |
| I/O | input/output |
| JEDEC | joint electron devices engineering council |
| JTAG | joint test action group |
| $\overline{\text { OE }}$ | output enable |
| SRAM | static random access memory |
| TAP | test access port |
| TCK | test clock |
| TDI | test data-in |
| TDO | test data-out |
| TMS | test mode select |
| TQFP | thin quad flat pack |
| TTL | transistor-transistor logic |

Synchronous Dual-Port RAM
Document Number: $38-06059$

| Rev. | ECN No. | Orig. of Change | Submission Date | Description of Change |
| :---: | :---: | :---: | :---: | :---: |
| ** | 111473 | DSG | 11/27/01 | Change from Spec number: 38-01056 to 38-06059 |
| *A | 111942 | JFU | 12/21/01 | Updated capacitance values <br> Updated switching parameters and IsB3 <br> Updated "Read-to-Write-to-Read (OE Controlled)" waveform <br> Revised static discharge voltage <br> Revised footnote regarding IsB3 |
| *B | 113741 | KRE | 04/02/02 | Updated $\mathrm{I}_{\mathrm{SH}}$ values Updated ESD voltage Corrected 0853 pins L3 and L12 |
| *C | 114704 | KRE | 04/24/02 | Added discussion of Pause/Restart for JTAG boundary scan |
| *D | 115336 | KRE | 07/01/02 | Revised speed offerings for all densities |
| *E | 122307 | RBI | 12/27/02 | Power up requirements added to Maximum Ratings Information |
| *F | 123636 | KRE | 1/27/03 | Revise $\mathrm{t}_{\mathrm{CD} 2}, \mathrm{t}_{\mathrm{OE}}, \mathrm{t}_{\mathrm{OHZ}}, \mathrm{t}_{\mathrm{CKHZ}}, \mathrm{t}_{\mathrm{CKLz}}$ for the CY7C0853V to 4.7 ns |
| *G | 126053 | SPN | 08/11/03 | Separated out 4M and 9M data sheets Updated $I_{S B}$ and $I_{C C}$ values |
| *H | 129443 | RAZ | 11/03/03 | Updated $\mathrm{I}_{\text {SB }}$ and $\mathrm{I}_{\mathrm{CC}}$ values |
| * | 231993 | YDT | See ECN | Removed "A particular port can write to a certain location while another port is reading that location." from Functional Description. |
| *J | 231813 | WWZ | See ECN | Removed $\times 36$ devices (CY7C0852/CY7C0851) from this datasheet. <br> Added $0.5 \mathrm{M}, 1 \mathrm{M}$ and $9 \mathrm{M} \times 18$ devices to it. <br> Changed title to FLEx18 3.3 V $32 \mathrm{~K} / 64 \mathrm{~K} / 128 \mathrm{~K} / 256 \mathrm{~K} / 512 \mathrm{~K} \times 18$ <br> Synchronous Dual-Port RAM. <br> Changed datasheet to accommodate the removals and additions. <br> Removed general JTAG description. Updated JTAG ID codes for all devices. <br> Added 144-ball FBGA package for all devices. <br> Updated selection guide table and moved to the front page. <br> Updated block diagram to reflect $\times 18$ configuration. <br> Added preliminary status back due to the addition of the new devices. |
| *K | 311054 | RYQ | See ECN | Minor Change: Correct the revision indicated on the footer. |
| *L | 329111 | SPN | See ECN | Updated Marketing part numbers Updated tRSF |
| *M | 330561 | RUY | See ECN | Added Byte Select Operation Table |
| *N | 375198 | YDT | See ECN | Removed Preliminary status Added $I_{\text {SB5 }}$ <br> Changed $\mathrm{t}_{\text {RSCNTINT }}$ to 10 ns |
| *O | 391525 | SPN | See ECN | Updated Counter reset section to reflect what is loaded into the mirror register |
| *P | 414109 | LIJ | See ECN | Corrected Ordering Codes for 0831 devices in the 133 MHz speed bin. Added CY7C0833AV-133BBI. |
| *Q | 461113 | YDT | SEE ECN | Changed VDDIO to VDD (typo) Added lead(Pb)-free parts Corrected typo in DC table |
| *R | 2544945 | VKN/AESA | 07/29/08 | Updated Template. Updated ordering information |
| *S | 2668478 | VKN/PYRS | 02/04/09 | Added CY7C0832BV part <br> Added footnote \#1 <br> Updated Ordering information table |

Use may be limited by and subject to the applicable Cypress software license agreement.

[^0]:    Notes
    7. CY7C0831AV has 17 address bits, CY7C0832AV/CY7C0832BV has 18 address bits and CY7C0833V has 19 address bits.
    8. These balls are not applicable for CY7C0833V device. They must be tied to VSS.
    9. These balls are not applicable for CY7C0833V device. They must be tied to VDD.
    10. These balls are not applicable for CY7C0833V device. They must not be connected.

[^1]:    Notes
    12. CY 7 C 0831 AV has 17 address bits, $\mathrm{CY} 7 \mathrm{C} 0832 \mathrm{AV} / \mathrm{CY} 7 \mathrm{C} 0832 \mathrm{BV}$ has 18 address bits and CY7C0833V has 19 address bits.
    13. $\overline{C E}$ is internal signal. $\overline{C E}=L O W$ if $\overline{C E}_{0}=L O W$ and $C E_{1}=H I G H$. For a single Read operation, CE only needs to be asserted once at the rising edge of the CLK and can be deasserted after that. Data is out after the following CLK edge and is three-stated after the next CLK edge.
    14. $\overline{O E}$ is "Don't Care" for mailbox operation.
    15. At least one of $\overline{\mathrm{BEO}}, \overline{\mathrm{BE1}}$ must be LOW.
    16. A18x is a NC for CY7C0832AV/CY7C0832BV, therefore the Interrupt Addresses are 3FFFF and 3FFFE. A18x and A17x are NC for CY7C0831AV, therefore the Interrupt addresses are 1FFFF and 1FFFE.
    17. "X" = "Don't Care," "H" = HIGH, "L" = LOW.
    18. CNTINT and CNTRST specs are guaranteed by design to operate properly at speed grade operating frequency when tied together.

[^2]:    Notes
    19. "X" = "Don't Care," "H" = HIGH, "L" = LOW.
    20. Counter operation and mask register operation is independent of chip enables.

[^3]:    Notes
    22. CY7C0831AV has 17 address bits, CY7C0832AV/CY7C0832BV has 18 address bits and CY7C0833V has 19 address bits.
    23. The " $X$ " in this diagram represents the counter upper bits
    24. Boundary scan is IEEE 1149.1-compatible. See Performing a Pause/Restart on page 11 for deviation from strict 1149.1 compliance

[^4]:    Notes
    26. The voltage on any input or I/O pin can not exceed the power pin during power up.
    27. Pulse width < 20 ns.
    28. $I_{\text {SB1 }}, I_{S B 2}, I_{S B 3}$ and $I_{S B 4}$ are not applicable for CY7C0833V because it can not be powered down by using chip enable pins
    29. $\mathrm{C}_{\text {OUT }}$ also references $\mathrm{C}_{1 / O}$.

[^5]:    Notes
    31. This parameter is guaranteed by design, but is not production tested.
    32. Test conditions used are Load 2.

[^6]:    Notes
    49. $\overline{C E}_{0}=\overline{\mathrm{BEO}}-\overline{\mathrm{BE} 1}=\mathrm{R} / \overline{\mathrm{W}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$. When R/ $\overline{\mathrm{W}}$ first switches low, because OE $=\mathrm{LOW}$, the Write operation cannot be completed (labelled as no operation). One clock cycle is required to three-state the $1 / O$ for the Write operation on the next rising edge of CLK.
    50. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{BEO}}-\overline{\mathrm{BE}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \mathrm{MSK}=\mathrm{HIGH}$.
    51. No dead cycle exists during counter reset. A Read or Write cycle may be coincidental with the counter reset.
    52. Retransmit happens if the counter remains in increment mode after it wraps to initially loaded value.

[^7]:    Notes
    53. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\overline{\mathrm{BEO}}-\overline{\mathrm{BE}}_{1}=\mathrm{LOW} ; \mathrm{CE}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{HIGH}$.
    54. Address in output mode. Host must not be driving address bus after $\mathrm{t}_{\mathrm{CKLZ}}$ in next clock cycle.
    55. Address in input mode. Host can drive address bus after $\mathrm{t}_{\mathrm{CKHZ}}$ -
    56. An * is the internal value of the address counter (or the mask register depending on the CNT/MSK level) being Read out on the address lines.

[^8]:    Notes
    57. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\overline{\mathrm{BE}}_{0}-\overline{\mathrm{BE}}_{1}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$.
    58. This timing is valid when one port is writing, and other port is reading the same location at the same time. If $\mathrm{t}_{\mathrm{Ccs}}$ is violated, indeterminate data is Read out. 59. If $t_{c c s}<$ minimum specified value, then $R$ Port is Read the most recent data (written by $L$ Port) only ( $2 * t_{\mathrm{C} Y \mathrm{C} 2}+t_{\mathrm{CD} 2}$ ) after the rising edge of $R$ Port's clock. If $t_{C C S} \geq$ minimum specified value, then $R$ _Port is Read the most recent data (written by $L_{-}$Port) ( $t_{C Y C 2}+t_{C D 2}$ ) after the rising edge of $R$ Port's clock.

[^9]:    Notes
    60. A18x is a NC for CY7C0832AV/CY7C0832BV, therefore the Interrupt Addresses are 3FFFF and 3FFFE. A18x and A17x are NC for CY7C0831AV, therefore the Interrupt addresses are 1FFFF and 1FFFE
    61. Retransmit happens if the counter remains in increment mode after it wraps to initially loaded value.
    62. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\overline{\mathrm{BE} 0}-\overline{\mathrm{BE} 1}=\mathrm{LOW} ; \mathrm{CE}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{HIGH}$.
    63. CNTINT is always driven.
    64. $\overline{\text { CNTINT goes LOW when the unmasked portion of the address counter is incremented to the maximum value. }}$
    65. The mask register assumed to have the value of 3FFFFh.

[^10]:    Notes
    66. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\overline{\mathrm{ADS}}=\overline{\mathrm{CNTEN}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\overline{\mathrm{CNTRST}}=\overline{\mathrm{MRST}}=\mathrm{CNT} / \overline{\mathrm{MSK}}=\mathrm{HIGH}$.
    67. Address "7FFFF" is the mailbox location for R_Port of the 9 Mb device.
    68. L_Port is configured for Write operation, and $\bar{R} \_$Port is configured for Read operation.
    69. At least one byte enable $\left(\mathrm{BE}_{0}-\mathrm{BE}_{1}\right)$ is required to be active during interrupt operations.
    70. Interrupt flag is set with respect to the rising edge of the Write clock, and is reset with respect to the rising edge of the Read clock.

[^11]:    Notes
    71. CY7C0831AV has 17 address bits, CY7C0832AV/CY7C0832BV has 18 address bits and CY7C0833V has 19 address bits
    72. "X" = "Don't Care," "H" = HIGH, "L" = LOW.
    73. OE is an asynchronous input signal.
    74. When $\overline{\mathrm{CE}}$ changes state, deselection and Read happen after one cycle of latency.
    75. $\overline{\mathrm{CE}}_{0}=\overline{\mathrm{OE}}=\mathrm{LOW} ; \mathrm{CE}_{1}=\mathrm{R} / \overline{\mathrm{W}}=\mathrm{HIGH}$.
