## DESCRIPTION:

The QS32257 is a high-speed CMOS LVTTL-compatible Quad 2:1 multiplexer/demultiplexer. The QS32257 is a function and pinout compatible QuickSwitch version of the 74F257,74FCT257, and the 74ALS/AS/LS257 Quad 2:1 multiplexers. The QS32257 has $25 \Omega$ series resistors to reduce ground noise.

Mux/Demux devices provide an order of magnitude faster speed than equivalent logic devices.

The QS32257 is characterized for operation at $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## NOTES:

1. For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.
2. Per TLL driven input ( V IN $=3.4 \mathrm{~V}$, control inputs only). I and Y pins do not contribute to $\Delta \mathrm{lcc}$.
3. This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The I and Y inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

## NOTES:

1. Minimums are guaranteed but not production tested.
2. This parameter is guaranteed but not production tested.
3. The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 1.25 ns for $\mathrm{CL}=50 \mathrm{pF}$. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
